Shobhit Institute of Engg. & Tech. (Deemed to-Be University) NH-58, Modipuram. Meerut-250110

B.Sc. Biomedical

Overview: B.Sc. Hons. Biomedical Sciences concerns with the topics to understand the biological principles that govern the functioning of the human body, to discover the mechanisms of any disease and to find new and distinct ways to cure a disease by developing advanced diagnostic tools or new therapeutic strategies. The B.Sc. (Hons) Biomedical Science started as an interdisciplinary course at Shobhit University, Meerut. It is the applied domain of life and natural sciences, used for diagnosis, prevention and treatment of human diseases. This course is suited for those students who are desirous of teaching at the college level. Students should have skills like identifying blood groups, interpreting results and liaising with medical staff, maintaining records and writing medical reports to seek admission to B.Sc. Hons. (Biomedical Sciences).

Program Outcome: Bachelor of Science (B.Sc.) offers theoretical as well as practical knowledge about different subject areas. These subject areas include Physics, Chemistry, Mathematics and Biology and other fields depending on the specialization a student opts. This programme course is most beneficial for students who have a strong interest and background in Science and Mathematics. The course is also beneficial for students who wish to pursue multi and inter-disciplinary science careers in future. Following are the various programme outcomes:

POs:

- 1 **Scientific knowledge:** Apply the knowledge of physics, chemistry, biology, zoology and mathematics to the solution of complex scientific problems.
- 2 Problem analysis: Identify, formulate, review research literature, and analyse complex Scientific problems reaching substantiated conclusions using first principles of physics, chemistry, biology, zoology and mathematics
- 3 **Design/development of solutions:** Design solutions for complex problems or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
- 4 **Conduct investigations of complex problems:** Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.

- 5 **Modern tool usage:** Create, select, and apply appropriate techniques, resources, and modern science and tools including prediction and modeling to complex scientific activities with an understanding of the limitations.
- 6 **The science and society:** Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional scientific practice.
- 7 Environment and sustainability: Understand the impact of the professional science solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
- 8 **Ethics:** Apply ethical principles and commit to professional ethics, responsibilities, and norms of the scientific practice.
- 9 **Individual and teamwork:** Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
- 10 **Communication:** Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
- 11 **Project management and finance:** Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
- 12 Life-long learning: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

Programme Specific Outcome:

PSO1. It helps to develop scientific temper and thus can prove to be more beneficial for the society as the scientific developments can make a nation or society to grow at a rapid pace. Science graduates can go to serve in industries or may opt for establishing their own industrial unit.

PSO2. After the completion of this course students have the option to go for higher studies i.e. M. Sc and then do some research for the welfare of mankind. After higher studies, students can join as scientist and can even look for professional job oriented courses.

PSO3. This course also offers opportunities for serving in Indian Army, Indian Navy, Indian Air Force as officers. Students after this course have the the option to join Indian Civil Services as IAS, IFS etc.

Eligibility Criteria:

B.Sc. Hons. Biomedical Sciences is a highest demanding program nowadays and as per experts it's been said that it is a job-oriented Bachelor's degree program which is of 3-years duration. Students who have passed Class 12 examination with Physics, Chemistry and Biology/ Mathematics or Both as compulsory subjects can pursue this program.

Course Code	Course name	Course outcomes		
		Semester 1	[
BBM- 101	Human Anatomy and Physiology	CO1	Label the functions of the human anatomy and physiology from a regional perspective for the following regions and systems: a. Head and neck, thoracic, abdominopelvic, and upper and lower extremities, Major skeletal muscles, their actions, origins, insertions, and peripheral nerves, Central nervous system and plexuses, Respiratory system, Cardiovascular/hematologic system. Identify the major structures of the human anatomy for the following: a. Head and neck, thoracic, abdominopelvic, and upper and lower extremities. Major skeletal muscles, their actions, origins, insertions, and peripheral nerves, Central nervous system and plexuses d. Respiratory system, Cardiovascular/hematologic system.	
		CO3	Identify the major bones and their processes as they relate to each region of the body.	
		CO4	Tell briefly the basic components and functions of the gastrointestinal, renal/urinary, endocrine/metabolic, hepatic/biliary, genital/reproductive and immunologic, systems.	
		CO5	Identify the findings from a simulated healthcare record such as electrocardiogram data and pulmonary ventilation outcomes.	

	BBM- 102 Organic Chemistry	CO1 CO2	 Know and recall the fundamental principles of organic chemistry that include chemical bonding, nomenclature, structural isomerism, stereochemistry, chemical reactions and mechanism. Name the functional groups and different class of organic compounds. Recognize the basic practical skills for the synthesis and analysis of organic compounds.
		CO3	Predict the reactivity of an organic compound from its structure; Develop basic skills for the multi-step synthesis of organic compounds; Justify a reasonable mechanism for a chemical reaction.
		CO4	Demonstrate ability to work independently as well as within a team
		CO5	Manage resources and time and get along well with other members of the group.
GBT- 101	Basic Cell Biology	CO1	Understand information about cells, including their composition, their function and cell-cycle checkpoints. The module on radiation biology will help to explore and gain insight into radiation-induced biological responses at

			molecular, cellular and tissue levels.
		CO2	Students will understand the structures and purposes of basic components of prokaryotic and eukaryotic cells, especially macromolecules, membranes, and organelles
		CO3	Students will understand how these cellular components are used to generate and utilize energy in cells.
		CO4	Students will understand the cellular components underlying mitotic cell division.
		CO5	Students will apply their knowledge of cell biology to selected examples of changes or losses in cell function. These can include responses to environmental or physiological changes, or alterations of cell function brought about by mutation.
		Semester: I	I
		CO1	Explain basic electrophysiology mechanism involve in bio-potential generation.
BBM-	Diagnostic and Therapeutic Instrumentation	CO2	explain the working of patient monitoring system, diagnostic and therapeutic equipments
201		CO3	Examine the bioelectrical and non-bioelectrical activities.
		CO4	Calibrate and handle the equipments related to the patient care and monitoring.

		CO5	Students will know the definitions, basic principles and the applications of the available diagnostic and therapeutic devices
		CO1	Trace the history and development of immunology.
		CO2	Distinguishes between self and foreign molecules and thus alerts and mediates protection against attack by potentially infectious organisms. Also, describe surface membrane barriers and their protective functions, importance of phagocytosis and natural killer cells in innate body defense.
BBM- 202	Immunology	CO3	Describe the roles of different types of T cells, B cells and APCs. Compare and contrast the origin, maturation process, and general function of B and T lymphocytes.
		CO4	Malfunctioning of the immune system leads to a number of disorders and diseases. Understanding the biology of the immune system is, therefore, key to developing strategies towards prevention and cure to a number of disorders and diseases that result due to interference in the functioning and regulation of the immune system.
GBT- 201	Principles of Genetics	CO1	Discussing the progression of discovery from Classical to Modern Genetics, Defining basic concepts of Classical Genetics, Describing Mendel's experimental design, Utilizing conventional Mendelian genetic terminology, Explaining Mendel's principles of segregation, and independent assortment.

		CO2 CO3	Solving monohybrid cross genetic outcomes utilizing branch diagrams and/or Panetta squares, Using testcrosses to identify parental genotype and confirm the principle of segregation. Solving dihybrid cross genetic outcomes utilizing branch diagrams and/or Punnett squares. Analyzing the results of multihybrid crosses to confirm the principle of Independent Assortment.
		CO4	Using the laws of probability to statistically analyze the outcomes of genetic crosses.
	 !	Semester II	I
BBM-301	Analytical Instrumentation and its Applications	CO1	Strategically plan analytical campaigns to apply to different types of samples and research objectives, including selection of the most appropriate technique/instrumentation for the students' research project.
		CO2	Undertake the correct sample preparation and characterization prior to analysis by the chosen techniques or instruments.
		CO3	Design an analytical work-flow to acquire data and achieve the research objectives of their project.
		CO4	Process data from the chosen instruments and demonstrate understanding of the limitations and quality of the data. Justify the approach taken to data processing.
		CO5	Write a clear and concise justification and description of the analytical techniques

			employed, suitable for publication in a scientific
			journal.
BBM-302	Medical Physics	CO1	Describe the construction and function of the x-
			ray system, describe the image formation process
			on radiographic film and digital imaging plates.
		CO2	Describe the conversion of a latent x-ray image
			into a radiologic image, Compare and contrast x-
			ray images with different quality characteristics.
		CO3	Describe how x-ray images are developed in a
		003	
			rapid film processor, Compare and contrast the
			basic radiation interactions that occur in matter
			exposed to x-rays.
		CO4	Explain how scattered radiation can affect the
			film and how its effects can be minimized,
			Recommend methods of improving an x-ray
			image with deficits. Describe the operating
			characteristics of conventional tomography
		CO5	Explain how fluoroscopy differs from
			conventional overhead radiography
BBM-303	Molecular Biology	CO1	Exhibit a base in genetics, knowledge on basic
			molecular Biology understanding of the execution
			of central dogma, and anatomy and physiology.
			Knowledge on the basic organization of the
			genome in prokaryotes and eukaryotes, on
			prokaryotic and eukaryotic replication,
			transcription and translation processes along with
			their discerning features.
		CO2	Demonstrate the knowledge of common and

		CO3	advanced laboratory practices in cell and molecular biologyExhibit clear and concise communication of scientific dataEngage in review of scientific literature in the areas of biomedical sciences, Critique and
			professionally present primary literature articles in the general biomedical sciences field
GBT-301	Microbiology	CO1	Student will understand the microbial structure, growth and development, methods and role of sterilization in the context of study of microbes, the pathogenic microbes and the diseases caused by them, also focus on mechanisms of microbial pathogenesis and the host response, and the scientific approaches to investigate pathogenesis processes and emerging antimicrobial resistance.
		CO2	Students will be able to acquire, articulate, retain and apply specialized language and knowledge relevant to microbiology.
		CO3	Students will acquire and demonstrate competency in laboratory safety and in routine and specialized microbiological laboratory skills applicable to microbiological research or clinical methods, including accurately reporting observations and analysis.
		CO4	Students will communicate scientific concepts, experimental results and analytical arguments

		CO5	clearly and concisely, both verbally and in writing. Students will demonstrate engagement in the Microbiology discipline through involvement in research or internship activities, the Microbiology Student Association club (MSA) and outreach or mentoring activities specific to microbiology.
SBM-301	Biocomputation	CO1 CO2	Student will understand basic Computational biology and bioinformatics, various databases and their classification Students would be able in Sequence alignment
		CO3	and visualization and Phylogenetic and microarray analysis Student will understand the discipline of
			computational biology and drug design, the different aspects of nucleotide and protein sequence analyses, sequence alignments and their applications in understanding biology.
		CO4	Students will understand the basic strategic issues in drug discovery and development, principles of computational methods involved in lead generation virtual screening, quantitative structureactivity relationship and molecular docking.

Semester-I	V		
BBM- 401	Pathology	CO1	Basic understanding of diseases and their pathogenesis, the topics are of introductory nature and build the concepts of how human system work in altered and diseased stage under the influence of various internal and external stimuli
		CO2	Describe topics like cellular adaptations, inflammation, neoplasia, cellular ageing and other infectious diseases.
		CO3	Get knowledge on laboratory exercises to substantiate and clarify the theoretical concepts.
		CO4	Upon successful completion of this course unit, the student should comprehend the general principles of disease and of biological and genetic processes involved in cancer development. The student should also be able to describe the most important diseases of selected organs.
BBM-402	Techniques for Forensic Science	CO1	Demonstrate competency in the collection, processing, analyses, and evaluation of evidence.
		CO2	Demonstrate competency in the principles of crime scene investigation, including the

			recognition, collection, identification,
			preservation, and documentation of physical
			evidence.
			evidence.
		CO3	
			Demonstrate an understanding of the scientific
			method and the use of problem-solving within the
			field of forensic science.
		CO4	Identify the role of the forensic scientist and
		04	•
			physical evidence within the criminal justice
			system.
		CO5	Demonstrate the ability to document and orally
			describe crime scenes, physical evidence, and
			scientific processes. Identify and examine current
			and emerging concepts and practices within the
			forensic science field.
BBM-403	Biochemistry	CO1	Demonstrate a broad knowledge of the
			fundamental introductory concepts of Chemistry,
			Biology and Physics.
			Demonstrate a thorough horough the first
		CO2	Demonstrate a thorough knowledge of the
			intersection between the disciplines of Biology
			and Chemistry.
		CO3	Demonstrate a proficiency in developing relevant
			biochemical questions, carrying out laboratory
			investigations to answer those questions, and

		CO4	critically analyzing, interpreting, and presenting in oral and written form the results of their experiments. Locate, critically analyze, interpret and discuss data, hypotheses, results, theories, and explanations found in the primary literature, applying knowledge from Chemistry and Biology.
		CO5	Appreciate the way in which practitioners in the disciplines of Biology and Chemistry intersect and bring their expertise to bear in solving complex problems involving living systems. Understand the societal impacts, both positive and negative, of science and technology and the limitations of science.
GBT-401	Toxicology	CO1	Critically evaluate different advanced exposure assessment methods
		CO2	Design strategies for exposure assessment
		CO3	Analyse and interpret exposure measurements applying different modelling tools (stochastic and deterministic)

		CO4	Characterize measurement error and its consequences
		CO5	Appreciate the advantages and disadvantages of toxicological and epidemiological studies for deriving dose-response relationships
SBM-401	Biostatistics	CO1	Student will understand statistical data analyses that come from deliberate experiment, the data collected from the population in the course of public health study and survey.
		CO2	Students will get training on how to conduct epidemiological surveys, design questionnaire and analyze the data. The students will get hands- on-training on 'R', a free software environment for statistical computing and graphics.
		CO3	use and interpret results of descriptive statistical methods effectively.
		CO4	Explain the principal methods of statistical inference and design.
		CO5	Read and learn new statistical procedures independently.
	·	Semester-V	7
BBM-501	Medicinal Chemistry	CO1	Correlating between pharmacology of a disease and its mitigation or cure.

		CO2	Understanding the drug metabolic pathways,
			adverse effect and therapeutic value of drugs.
		CO3	Knowing the structural activity relationship of different class of drugs.
		CO4	Well acquainted with the synthesis of some important class of drugs.
		CO5	Knowledge about the mechanism pathways of different class of medicinal compounds. 6. To understand the chemistry of drugs with respect to their pharmacological activity.
BBM-502	Medical Biotechnology	CO1	Students will understand infections caused by different bacteria and viruses, and learn the basic techniques and methods used in the diagnosis and therapy of various human diseases and in the production of biopharmaceuticals,
		CO2	Understand the concepts of cloning and expression of the desired gene. Students will understand how biological systems are applied in the advancement of medical biotechnology

		CO3	Develop an understanding of the Cytoskeleton and Cell Membrane.
		CO4	Discuss the structure of Microtubules, microfilaments.
BMD- 501	Pharmacology	CO1	Identify the fundamental principles of pharmacokinetics and pharmacodynamics.
		CO2	Apply the pharmacodynamic and pharmacokinetic principles that describe drug actions in humans.
		CO3	Compare and contrast the specific pharmacology of the major classes of drugs, important distinctions among members of each class, the risks and benefits, in relation to the organ systems they affect, and the diseases for which they are used therapeutically.
		CO4	Identify the role of molecular genetics and genomic principles in pharmacotherapeutics and drug development.
BMD- 502	Radiation Biology	CO1	Describe direct and indirect interactions between radiation and cells, describe the molecular basis of cellular radio sensitivity.
		CO2	Explain the influence of cell cycle, repair, repopulation and reoxygenation on tissue radio sensitivity, describe the components of a cell

	survival curve, given clinical data, draw a cell survival curve.
CO3	Differentiate between cell survival curves of varying LET radiations, hypoxic and aerated cells as well as cell cycle phases, Identify the acute and late effects of radiation on living tissue.
CO4	Describe the effects of whole body radiation, describe the long term effects of radiation, explain the effects of radiation on the developing embryo and fetus at each stage.
CO5	Explain the effects of time, dose and fractionation on long term side effects and treatment effectiveness, describe the relationship between LET, RBE and OER

Semester: VI

BBM-	Hospital Management	CO1	Understand the need and importance of cost
601			effective sustainable healthcare through demand generation and enhanced quality care
		CO2	Develop and apply various employee friendly systems for effective functioning of different administrative activities and support services of
			hospital.

		CO3	Promote patient centred care with a continuous quality improvement orientation ensure smooth functioning of core process by forecasting, streamlining patient flow, staff scheduling, planning space/ facilities/ supplies, maintenance, etc.
		CO4	Ensure optimum tilization of available limited resources, Sharpen managerial skills. Have an appreciation on the use of information technology in the hospital
BMD- 601	Medical Ethics	CO1	Provide students with the research competencies required to work as professional scholars in bioethics
		CO2	train students in examining and analyzing the salient topics of contemporary healthcare ethics, especially regarding their normative, global and religious dimensions
		CO3	provide students with clinical experience through rotations in various clinical settings
		CO4	assist student in writing a practical project that qualifies for the professional doctorate
BMD- 602	IPR	CO1	Students will understand the need for creation, protection, and commercialization of intellectual property in the area.

		CO2	Knowledge on various forms of Intellectual Property Rights, deals with the entire process of patent filling and taking some case studies.
		CO3	The students once they complete their academic projects, they get awareness of acquiring the patent and copyright for their innovative works.
		CO4	They also get the knowledge of plagiarism in their innovations which can be questioned legally.
BBM- 671	Project Work	CO1	Student will understand how to connect the theoretical knowledge with actual practical things.
		CO2	Student will get a clear explanation of how the project works address to solve the Statement of a Problem. Student will get a perfect training a on research domain.

PRACTICALS (Wherever wet lab experiments are not possible the principles and concepts can be demonstrated through any other material or medium including videos/virtual labs etc.)

- 1. Preparation of solutions based on molarity, normality, percentage, dilutions etc.
- 2. Preparation of buffers.
- 3. Qualitative tests for carbohydrates to identify the given unknown carbohydrate solution: Mohlisch, Barfoed, Fehling/ Tollen/ Benedict, Selvinoff, Osazone, Bial"stests.
- 4. To determine the Iodine number of the given oil/ fat.
- 5. To find pKa value of given acetic acid/ amino acid.
- 6. Qualitative test for the protein
- 7. Isolation of the casein from the milk sample
- 8. Qualitative test for the amino acids.

Pre- requisites (if any)	Basic knowledge of			0.			
Objectives	The immune system distinguishes between self and foreign molecules and thus alerts and mediates protection against attack by potentially infectious organisms. Malfunctioning of the immune system leads to a number of disorders and diseases. Immunobiology is a comprehensive study of the organization and functioning of the immune system with its network of cells and molecules. Understanding the biology of the immune system is, therefore, key to developing strategies towards prevention and cure to a number of disorders and diseases that result due to interference in the functioning and regulation of the immune system. This paper covers the structure, organization, function and regulation of and by the immune system keeping the above aspects in mind.						
Outcomes	 After going through this unit student shall be able to: 1. Trace the history and development of immunology. 2. Describe surface membrane barriers and their protective functions. 3. Explain the importance of phagocytosis and natural killer cells in innate body defense. 4. Describe the roles of different types of T cells, B cells and APCs. Compare and contrast the origin, maturation process, and general function of B and T lymphocytes. 						
Unit I	Introduction to Immunology: History and terminology, innate and acquired immunity, active and passive immunity, immune responses, cells (T-cells, B-cells) and organs of immune system, cell mediated and humoral immunity, cytokines, toll-like receptors.					08	
Unit II	Antibody: Classification, isotypes, fine structure, biosynthesis of immunoglobulin, complement system. Antigen: Nature of antigens, haptens, adjuvants, vaccines.			08			
Unit III	MHC complex: Function, structure and MHC restriction.					08	
Unit IV	Principles of virulence and pathogenicity: Host-parasite interactions. Transplantation and tumor immunology: Tumor cell immunity, transplantation of tissues and organs, relationship between donor and recipient, role of MHC molecules in allograft rejection, bone marrow and haematopoietic stem cell transplantation, tumor antigen, tumor immunoprophylaxis. Autoimmune diseases: Autoimmune hemolytic anemia, systemic lupus erythematosus, multiple sclerosis, rheumatoid arthritis, AIDS, diabetes mellitus. Inflammation and hypersensitivity: Hypersensitivity reactions, inflammasome.					08	
Unit V	Applied immunology: Antigen-antibody interaction, affinity and avidity, agglutination and precipitation reactions, immunoflourescence, fluorescence activated cell sorting analysis. Antibody engineering: Hybridoma and monoclonal antibody (Mab), recombinant antibody molecules, human and humanized antibodies, uses of Mab. Antigen engineering: ELISA, RIA, immunodiffusion, immunoelectrophoresis, immunoblotting, antibody for diagnosis, antibody for therapy, cytokine therapy

Objectives	analytical branche understand inherit inheritance. The c development of th deviate from Men way they have con forward genetics h that is applicable will be at the in	Genetics having its roots in mathematics thanks to Mendel, appeals to students as one of the analytical branches of biology even in senior school. Basic concepts that are essential to understand inheritance will be taught, starting from the abstract factors to physical basis of inheritance. The course aims to communicate the pivotal role of Mendelian concepts in the development of the science of genetics and also the fact that nature is full of examples that deviate from Mendelian laws starting from linkage groups. Introduction of models and the way they have contributed to our understanding of genetics will provide a perception of how forward genetics has been used to understand the basis of continuity of information transfer that is applicable to not only to the simple life forms but also to humans. Most of the topics will be at the introductory level, which would motivate the students to understand the										
Outcomes	The student will de 1. Discussing the p 2. Defining basic of 3. Describing Men 4. Utilizing convert 5. Explaining Men 6. Solving monol squares. 7. Using testcrosset 8. Solving dihybri 9. Analyzing the Assortment.	 Using testcrosses to identify parental genotype and confirm the principle ofsegregation. Solving dihybrid cross genetic outcomes utilizing branch diagrams and/or Punnett squares. Analyzing the results of multihybrid crosses to confirm the principle of Independent 										
Unit I	it I Mendelian genetics: Mendel's law of inheritance, Mendelian ratio, linkage, crossing over, chromosomal theory of inheritance. Chromosome mapping: linkage analysis, two point test cross, three point test cross, interference, coefficient of coincidence, chi-square analysis.											
Unit II	Structural and numerical changes in chromosomes: Chromosomal aberration (deletion, duplication, translocation and inversion), euploidy and aneuploidy, aneuploidy in human. Mutations: Natural and induced mutations, physical and chemical mutagens, Ames test, uses of mutations in genetic studies, human health and crop improvement. Biochemical and microbial genetics:Neurospora as model system, one gene one enzyme hypothesis.08											
Unit III	Sex determination: Sex linked inheritance, determination of sex and dosages compensation. Chloroplast and mitochondrial genetics: Cytoplasmic inheritance, chloroplast inheritance in plants, mitochondrial genes in yeast. 08

Objectives	interdisciplinary f applied to underst organisms and en This paper cover biophysics and in basic cellular func	Biological phenomena cannot be understood fully without physical insight. Biophysics is an interdisciplinary frontier of science in which the principles and techniques of physics are applied to understand biological problems at every level, from atoms and molecules to cells, organisms and environment. The work always aims to find out how biological systems work. This paper covers various spectroscopic techniques, hydrodynamic methods, molecular biophysics and introduction to various physical principles responsible for maintaining the basic cellular function and integrity of biological membranes including transport across them.							
Outcomes	 Students would be able to: Strategically plan analytical campaigns to apply to different types of samples and resear objectives, including selection of the most appropriate technique/instrumentation for the students' research project. Undertake the correct sample preparation and characterization prior to analysis by the chosen techniques or instruments. Design an analytical work-flow to acquire data and achieve the research objectives their project. Process data from the chosen instruments and demonstrate understanding of the limitations and quality of the data. Justify the approach taken to data processing. Write a clear and concise justification and description of the analytical technique employed, suitable for publication in a scientific journal.

Objectives	equipment design the imaging proces	and fu ss will	nction. be dise	The p cussed	to basic principles of medical imaging and in production of x-rays, their characteristics and t and demonstrated. The role of exposure facto ssed and demonstrated. Special Imaging Moda	heir role in rs and the				
Outcomes	 Students would be able to: 1. Describe the construction and function of the x-ray system. 2. Describe the image formation process on radiographic film and digital imaging plates. 3. Describe the conversion of a latent x-ray image into a radiologic image. 4. Compare and contrast x-ray images with different quality characteristics. 5. Describe how x-ray images are developed in a rapid film processor. 6. Compare and contrast the basic radiation interactions that occur in matter exposed to x-rays 7. Explain how scattered radiation can affect the film and how its effects can be minimized. 8. Recommend methods of improving an x-ray image with deficits. 9. Describe the operating characteristics of conventional tomography 10. Explain how fluoroscopy differs from conventional overhead radiography 									
Unit I	Bioelectromagnetics: Non-ionizing electromagnetic field, introduction to extremely low frequency, radio & microwave frequency, environmental and man made sources of extremely low frequency, natural electric and magnetic field, biophysical mechanism, established interactions, biological effect of power frequency, biohazard and effects of electromagnetic field.									
Unit II	Chromatography : Gas solid Chromatography , Gas liquid Chromatography, High performance liquid chromatography, ion exchange chromatography, paper chromatography, thin layer chromatography, column chromatography, gel									
Unit III	permeation chromatography Radioanalytical methods : Neutron activation analysis, isotope dilution analysis, Radiometric titrations, particle induced X-ray Emission, Use of radioisotopes - in industry, agriculture and physicochemical studies .									
Unit IV	Deviation from Introduction, bas	Spectroscopic Techniques U V Introduction to spectroscopy, Lambert Beer's law, Deviation from Lambert Beer s law, instrumentation and applications IR Introduction, basic principles, factors affecting IR group frequencies, Instrumentation and Applications								
Unit V	Instrumentation and Applications NMR Basic principles, elementary ideas and instrumentation chemical shifts, spin-spin coupling, instrumentation and applications Mass Spectroscopy: Introduction, basic principles, applications and uses ESR: Principle, instrumentation and applications X-ray Spectroscopy: X-ray absorption, methods, diffraction methods Raman Spectroscopy : Principle instrumentation and applications

Objectives	and their pathogen human system wo external stimuli T knowledge studer cellular adaptation	The curriculum of pathology aims at preparing the students in basic understanding of diseases and their pathogenesis. The topics are of introductory nature and build the concepts of how human system work in altered and diseased stage under the influence of various internal and external stimuli Thus the syllabi of pathology compliments and supplements the necessary knowledge students have gained in Physiology. Consequently it incorporates topics like cellular adaptations, inflammation, neoplasia, cellular ageing and other infectious diseases. Laboratory exercises have been designed to substantiate and clarify the theoretical concepts.						
Outcomes	principles of disea	se and	of bio	logica	ourse unit, the student should comprehend the l and genetic processes involved in cancer dev scribe the most important diseases of selected of	elopment.

Category	Core Biomedical							
Course title	Techniques for Forensic Science							
Scheme and Credits	Credit 4	L 4	T	P 0				
Pre- requisites (if any)	4 None							
Objectives	Forensic science is the application of scientific knowledge to questions of civil and criminal law. Interest in forensic science has grown considerably in recent years. Keeping this in view, the present forensic science course is designed for students to explore how forensic scientist's work, the tools and techniques they use and how they reach the conclusions they present in court. This engage students in using a creative, problem solving and inquiry based approach to investigate the crime scene. It also explains the characteristics of a fingerprint collect, process, and analyze fingerprint evidence and explain DNA analysis.							
Outcomes	 At the completion of the Forensic Science Technology student will be able to: Demonstrate competency in the collection, processing, analyses, and evaluation of evidence. Demonstrate competency in the principles of crime scene investigation, including the recognition, collection, identification, preservation, and documentation of physical evidence. Demonstrate an understanding of the scientific method and the use of problem-solving within the field of forensic science. Identify the role of the forensic scientist and physical evidence within the criminal justice system. Demonstrate the ability to document and orally describe crime scenes, physical evidence, and scientific processes. Identify and examine current and emerging concepts and practices within the forensic science field. 							
Unit I	Crime Scene Investigation :Introduction and principles of forensic science,08Forensic science laboratory and its organization and service, tools and techniquesoperandi techniques08operandi in criminal investigationoperandi techniques08				08			
Unit II	Types of injuries and death : Classification of injuries and their medico-legal aspects, method of assessing various types of deaths, Case studies to depict different types of injuries and death. 08							
Unit III	Forensic chemistry and Ballistics: Classification of fire arms and explosives, 08 introduction to internal, external and terminal ballistics. Chemical evidence for explosives. 08							
Unit IV	Forensic Graphology: General and individual characteristics of handwriting, examination and comparison of handwritings and analysis of ink various samples. Forensic Toxicology Role of the toxicologist, significance of toxicological findings08							
Unit V	Fingerprint analysis: Fundamental principles of fingerprinting, classification of fingerprints, development of finger print as science for personal identification, Principle of DNA fingerprinting, application of DNA profiling in forensic medicine. Cyber Forensic Investigation08

Outcomes	 Students would be able to: Demonstrate a broad knowledge of the fundamental introductory concepts of Chemistry, Biology and Physics. Demonstrate a thorough knowledge of the intersection between the disciplines of Biology and Chemistry. Demonstrate a proficiency in developing relevant biochemical questions, carrying out laboratory investigations to answer those questions, and critically analyzing, interpreting, and presenting in oral and written form the results of their experiments. Locate, critically analyze, interpret and discuss data, hypotheses, results, theories, and explanations found in the primary literature, applying knowledge from Chemistry and Biology. Appreciate the way in which practitioners in the disciplines of Biology and Chemistry intersect and bring their expertise to bear in solving complex problems involving living systems. Understand the societal impacts, both positive and negative, of science and technology and the limitations of science.

Objectives	Different types of poisons have been known to humans since ages. Even in early times when science was in its infancy, curious people such as "Paracelsus" could predict "Every substance is a poison and, it is the right dose of the substance which differentiates remedy from poisons". This thought is fundamental even to modern toxicology and pharmacology. There is an increasing use of chemicals in the modern society and hence, toxicology is becoming a more important subject to study with the passage of time. Modern toxicology is a vast, multidisciplinary subject encompassing various other basic fields of science. The present course content is designed to provide the basics of toxicology. Relevant importance has been given to those topics which can build a strong foundation in the subject, based on which, facts can be assimilated during subsequent higher studies.						
Outcomes	 Student would be able to: Critically evaluate different advanced exposure assessment methods Design strategies for exposure assessment Analyse and interpret exposure measurements applying different modelling tools (stochastic and deterministic) Characterize measurement error and its consequences Appreciate the advantages and disadvantages of toxicological and epidemiological studies for deriving dose-response relationships 						
Unit I	classification of significance. Effe xenobiotics on its	toxic ect of toxici	sub durati ty. Ch	stance ion, f aracte	Different areas of modern toxicology, s, various definitions of toxicological requency, route and site of exposure of ristic and types of toxic response. Types of xenobiotics exposure in humans. Tolerance	08	
Unit II	Evaluation and mechanism of toxicity : Various types of dose response 08 relationships, assumptions in deriving dose response, LD50, LC50, TD50 and therapeutic index. Delivery of the toxicant, mechanisms involved in formation of ultimate toxicant, detoxification of ultimate toxicant. 08				08		
Unit III	Xenobiotics and	toxic a kenobio	gents	I	Absorption, Distribution, Excretion and nsformation, Phase- I reactions including	08	
Unit IV	Reductions and phase II conjugation reactions).Toxic insult to liver, its susceptibility to toxicants with reference to any two hepatotoxicants.Human exposure, mechanism of action and resultant toxicities of the following xenobiotics: Metals: lead, arsenic, Pesticides: organophosphates, carbamates, organochlorine, bipyridyl compounds and anticoagulant pesticides.						
Unit V	organocinomic, orpyridyr compounds and antreoagurant pesticides.co-toxicology and Clinical toxicologyBrief introduction to avian and aquatic toxicology, movement and effect of toxic compounds in food chain (DDT, mercury), bioaccumulation, biomagnification, acid rain and its effect on ecosystems, concept of BOD and COD. Management of poisoned patients, clinical methods to decrease absorption and enhance excretion of toxicants from the body use of antidotes.08						
Course code	GBT-451					CR.	
Course title	Toxicology Lab.					2.0	

PRACTICALS (Wherever wet lab experiments are not possible the principles and concepts can be demonstrated through any other material or medium including videos/virtual labs etc.)

1. Separation of a mixture of benzoic acid, beta- napthol and napthelene by solvent extraction and identification of their functional Groups.

2. Determination of Dissolved oxygen (DO) using Winkler's method.

3. Determination of Biological oxygen demand (BOD) of water.

4. To perform quantitative estimation of residual chlorine in water samples.

- 5. To determine the total hardness of water by complexo-metric method using EDTA.
- 6. To determine acid value of the given oil sample.
- 7. To estimate formaldehyde content of given sample.

8. Calculation of LD50 value of an insecticide from the data provided.

9. Determination of COD (chemical oxygen demand) of the given water sample.

Objectives	In public health work, one may be concerned with planning of experiments and the analysis of their results. Therefore, one has to deal with statistical data analyses that come from no deliberate experiment but that arise because of the data collected from the population in the course of public health study and survey. This course therefore provides training to the students on how to conduct epidemiological surveys, design questionnaire and analyze the data. The students will get hands-on-training on 'R', a free software environment for						
Outcomes	 statistical computing and graphics. After the completion of this course students would be able to: use and interpret results of, descriptive statistical methods effectively. Explain the principal methods of statistical inference and design. Read and learn new statistical procedures independently. 						
Unit I	Descriptive Statistics Data in Biology: Development in biostatistics, samples and populations, techniques of sampling (random and stratified), sampling and non-sampling errors, variables in biology, accuracy, precision, univariate and bivariate frequency distributions and their graphical representations. Measures of Central Tendency: Arithmetic means, mode, median and partition values.						
Unit II	Measures of Dispersion: Range, standard deviation, coefficient of variance and covariance.08Moments: Raw and central moments and their relationships. Measures of Skewness: Pearson''s and Bowley''s coefficients of skewness, Measures of Kurtosis.08						
Unit III	Correlation Analysis: Pearson"s and Spearman"s coefficients of correlation, coefficient of determination, standard and probable errors. 08						
Unit IV	Regression Analysis: Method of least squares, equations of lines of regression and their applications in biostatistics. 08						
Unit V	Probability and Probability DistributionsProbability: Basic concepts, addition08and multiplication rules of probability, conditional probability, Bayes" theoremand its applications in biostatistics.

Because cells are th considered one of the most important areas of formation about cells, including their composit The module on radiation biology will help to en ological responses at molecular, cellular and ti	biological ion, their xplore and				
Outcomes	 End of this course students would be able to: Describe direct and indirect interactions between radiation and cells. Describe the molecular basis of cellular radiosensitivity. Explain the influence of cell cycle, repair, repopulation and reoxygenation on tissue radiosensitivity. Describe the components of a cell survival curve. Given clinical data, draw a cell survival curve. Differentiate between cell survival curves of varying LET radiations, hypoxic and aerated cells as well as cell cycle phases. Identify the acute and late effects of radiation on living tissue. Describe the long term effects of radiation. Explain the effects of radiation on the developing embryo and fetus at each stage. Explain the effects of time, dose and fractionation on long term side effects and treatment effectiveness. 									
Unit I	Basic principles of electromagnetic radiation: Energy, wavelength, wave08numbers and frequency, review of electronic structure of molecules.08					08				
Unit II	Introduction of radiation biology : Basic concept of radioisotopes, types of radioactive decay (gamma and beta emitter), half-life, detection and measurement of radioactivity methods based upon ionization (GM counter), methods based upon excitation (scintillation counter). Use of radioisotopes in cell biology in understanding of DNA replication (bidirectional and theta replication), transcription (labeling of RNA) and labeling of protein using labeled amino acid. Use of radioisotopes in biology: Autoradiography, radioisotopes in diagnosis (thyroid disorders, cancer) and therapy (radiotherapy). Effect of radiations (ionizing and non-ionizing) on living systems, radiation induced damage to cell (chromosome and DNA damage), precautions and safety measures in handling radioisotopes.									
Unit III	Techniques in Radiation Biology UV-visible spectrophotometry: Beer Lambert 08 law, light absorption and its transmittance, factors affecting absorption properties 08 of a chromophore, structural analyses of DNA/ protein using absorption of UV 100 light., Fluorescence spectroscopy: Theory of fluorescence, static and dynamic quenching, resonance energy transfer, fluorescent probes in the study of protein and nucleic acids. 08									
Unit IV	analysis of secon	dary s	structu	re of	ular dichroism: Principle of ORD and CD, proteins (denatured and native form) and pectroscopy: Theory of IR, identification of	08				

	exchangeable hydrogen, number of hydrogen bonds, tautomeric forms.							
	Magnetic resonance spectroscopy and X-ray crystallography	08						
Unit V	Basic theory of NMR, chemical shift, medical applications of NMR. Mass spectrometry (MALDI-TOF): Physical basis and uses of MS in the analysis of proteins/ nucleic acids.: Diffraction,Bragg"s law and electron density maps (concept of R-factor and B-factor), growing of crystals (Hanging drop method). Objectives	ethical issues. The molecular biology entire environmer increase in our abi- bioethics. The pre- confronts. Topics biosafety, biotech responsible use of	The recent advances in the field of biotechnology have brought into focus several safety and ethical issues. The inventions in the field of genetic engineering and related fields of molecular biology not only affect us but also the plants, microorganisms, animals and the entire environment and the way we practice agriculture, medicine and food processing. An increase in our ability to change life forms in recent years has given rise to the new science of bioethics. The present course focus on the biosafety and bioethical issues the modern society confronts. Topics such as biosafety levels, GM food debate, impact of biotechnology on biosafety, biotech products and ethical issues, governance of biosafety, environmentally responsible use of biotechnology, clinical ethics will be discussed in the curriculum.									
Outcomes	 provide stude in bioethics train students ethics, especia provide stude 	 This course will provide students with the research competencies required to work as professional scholars in bioethics train students in examining and analyzing the salient topics of contemporary healthcare ethics, especially regarding their normative, global and religious dimensions provide students with clinical experience through rotations in various clinical settings

(if any) Objectives	considered to ha considered as int and society at lar new and useful understand the ne	Developments in the recent years has increased the knowledge acquisition process which is considered to have commercial value as well. The knowledge pool so generated can be considered as intellectual property which has grown tremendously in academic community and society at large. The pace with which our modern science is progressing today, various new and useful inventions take place. Through this paper, students are made aware to understand the need for creation, protection, and commercialization of intellectual property in the area. Various forms of Intellectual Property Rights are also explained. Paper also deals									
Outcomes	The students once	e they c ght for	omple their in	te thei nnova	ir academic projects, they get awareness of ac tive works. They also get the knowledge of pl						
Unit I	rights, provision of copy right, patent	Introduction: meaning of property, origin, nature, meaning of intellectual property rights, provision of ipr under trips and wto. Kinds of intellectual property rights— copy right, patent, trade mark, trade secret and trade dress, design, layout design, geographical indication, plant varieties and traditional knowledge									
Unit II	Patent rights and copy rights— origin, meaning of patent, types, inventions which are not patentable, registration procedure, rights and duties of patentee, assignment and licence, restoration of lapsed patents, surrender and revocation of patents, infringement, remedies & penalties. Copy right—origin, definition &types of copy right, registration procedure, assignment & licence, terms of copy right, infringement, remedies, copy rights with special reference to software.08

B.Sc Biomedical (2018-19) COs Mapping with POs & PSOs (Three Level : 3-Strongly Related , 2-Moderate, 1-Slightly)

BBM-101Human Anatomy and Physiology

Course Outcomes:

CO 1:Major skeletal muscles, their actions, origins, insertions, and peripheral nerves. c. Central nervous system and plexuses d. Respiratory system e. Cardiovascular/hematologic system

CO 2:Identify the major structures of the human anatomy for the following: a. Head and neck, thoracic, abdominopelvic, and upper and lower extremities. b. Major skeletal muscles, their actions, origins, insertions, and peripheral nerves. c. Central nervous system and plexuses d. Respiratory system e. Cardiovascular/hematologic system

CO 3:Identify the major bones and their processes as they relate to each region of the body.

CO 4:Briefly tell the basic components and functions of the gastrointestinal, renal/urinary, endocrine/metabolic, hepatic/biliary, genital/reproductive and immunologic, systems.

CO 5:Identify the findings from a simulated healthcare record such as electrocardiogram data and pulmonary ventilation outcomes.

BBM-151Anatomy and Physiology Lab

Course Outcomes:

CO 1:To study different human organs and their sections through permanent histological slides.

CO 2:Estimation of hemoglobin (Sahli's method) and determination of blood group.

CO 3:Determination of bleeding time and clotting time of blood.

CO 4:Determination of total sugar in blood.

CO 5:To study the structure and function of human body.

CO 6:Evaluation of electrophysiological parameters.

CO 7:To analyze the Human body composition using Bioelectrical Impedance Analyzer.

BBM-102 Organic Chemistry

Course Outcomes:

reactions along with introduction to biomolecules

CO 1:Know and recall the fundamental principles of organic chemistry that include chemical bonding, nomenclature, structural isomerism, stereochemistry, chemical reactions and mechanism.

CO 2:Name the functional groups and different class of organic compounds. Recognize the basic practical skills for the synthesis and analysis of organic compounds.

CO 3:Predict the reactivity of an organic compound from its structure; Develop basic skills for the multi-step synthesis of organic compounds; Justify a reasonable mechanism for a chemical reaction.

CO 4:Demonstrate ability to work independently as well as within a team.

CO 5:Manage resources and time and get along well with other members of the group.

BBM-152 Organic Chemistry Lab

Course Outcomes:

CO 1: Preparation of solutions based on molarity, normality, percentage, dilutions etc.

CO 2: Preparation of buffers.

CO 3: Qualitative tests for carbohydrates to identify the given unknown carbohydrate solution: Mohlisch, Barfoed, Fehling/ Tollen/ Benedict, Selvinoff, Osazone, Bial^{**}stests.

CO 4: To determine the Iodine number of the given oil/ fat.

CO 5: To find pKa value of given acetic acid/ amino acid.

CO 6: Qualitative test for the protein

CO 7: Isolation of the casein from the milk sample

CO 8:Qualitative test for the amino acids.

GBT-101 Basic Cell Biology

Course Outcomes:

CO1: Students will understand the structures and purposes of basic components of prokaryotic and eukaryotic cells, especially macromolecules, membranes, and organelles

CO2: Students will understand how these cellular components are used to generate and utilize energy in cells

CO3: Students will understand the cellular components underlying mitotic cell division. 4. Students will apply their knowledge of cell biology to selected examples of changes or losses in cell function. These can include responses to environmental or physiological changes, or alterations of cell function brought about by mutation.

GBT-151 Cell Biology Lab

Course Outcomes:

CO1:Microscopy- Theoretical knowledge of Light and Electron microscope.

CO2:To study the following techniques through electron/ photomicrographs: fluorescence microscopy, autoradiography, positive staining, negative staining, freeze fracture, freeze etching shadow casting, endocytosis and phagocytosis.

CO3:To explain mitosis and meiosis using permanent slides.

CO4:To cytochemically demonstrate presence of proteins in cheek cells or onion peel using mercuric bromophenol blue or fast green.

CO5:To cytochemically demonstrate presence of carbohydrates in cheek cells or onion peel using periodic acid Schiff's reagent.

CO6: To cytochemically demonstrate presence of DNA in cheek cells or onion peel using Feulgen reagent.

CO7:To study the effect of isotonic, hypotonic and hypertonic solutions on cells. 8. To prepare polytene chromosomes.

BBM-201 Diagnostic and Therapeutic Instrumentation

Course Outcomes:

CO 1: Explain basic electrophysiology mechanism involve in bio-potential generation.

CO 2: explain the working of patient monitoring system, diagnostic and therapeutic equipment's

CO 3: Examine the bioelectrical and non-bioelectrical activities.

CO 4:Calibrate and handle the equipment's related to the patient care and monitoring.

CO 5:Students will know the definitions, basic principles and the applications of the available diagnostic and the applications of the available diagnostic and

BBM-202Immunology:

Course Outcomes:

CO 1:Trace the history and development of immunology.

CO 2:Describe surface membrane barriers and their protective functions.

CO 3:Explain the importance of phagocytosis and natural killer cells in innate body defense.

CO 4:Describe the roles of different types of T cells, B cells and APCs. Compare and contrast the origin,

maturation process, and general function of B and T lymphocytes.

BBM-252 Immunology Lab

Course Outcomes:

CO1: Estimation of hemoglobin (Sahli"s method) and determination of blood group.

CO2: Determination of bleeding time and clotting time of blood.

CO3: Determination of total erythrocyte count.

CO4: Determination of total leukocyte count.

CO5: Preparation of blood smears and identifying various WBC

CO6: To perform differential leukocyte count of blood.

CO7: Determination of specific gravity of blood.

CO8:Determination of osmotic fragility.

GBT-201 Principles of Genetics

Course Outcomes:

CO1:Discussing the progression of discovery from Classical to Modern Genetics.

CO2:Defining basic concepts of Classical Genetics.

CO3:Describing Mendel's experimental design.

CO4:Utilizing conventional Mendelian genetic terminology.

CO5: Explaining Mendel's principles of segregation, and independent assortment.

CO6:Solving monohybrid¬cross genetic outcomes utilizing branch diagrams and/or Punnett squares.

CO7:Using testcrosses to identify parental genotype and confirm the principle ofsegregation.

CO8:Solving dihybrid cross genetic outcomes utilizing branch diagrams and/or Punnett squares.

CO9: Analyzing the results of multihybrid crosses to confirm the principle of Independent Assortment.

CO10:Using the laws of probability to statistically analyze the outcomes of genetic crosses.

GBT-251 Genetics Lab

Course Outcomes:

CO1: Verification of Mendelian laws through dominant, recessive, test and back cross.

CO2: Verification of sex-linked characteristics, linkage and crossing over mechanism.

CO3: Verification of population genetics

CO4:Pedigree charts of some common characters like blood group, color blindness and PTC testing

BBM-301 Analytical Instrumentation and its Applications

Course Outcome:CO 1: Strategically plan analytical campaigns to apply to different types of samples and research objectives, including selection of the most appropriate technique/instrumentation for the students' research project.

CO 2: Undertake the correct sample preparation and characterization prior to analysis by the chosen techniques or instruments.

CO 3: Design an analytical workflow to acquire data and achieve the research objectives of their project.

CO 4: Process data from the chosen instruments and demonstrate understanding of the limitations and quality of the data. Justify the approach taken to data processing.

CO :5Write a clear and concise justification and description of the analytical techniques employed, suitable for publication in a scientific journal.

BBM-351 Analytical Instrumentation Lab

CO1:Effect of different solvents on UV absorption spectra of proteins.

CO2: Study of structural changes of proteins at different pH using UV spectrophotometry.

CO3:Study of structural changes of proteins at different temperature using UV spectrophotometry. 4.

Determination of melting temperature of DNA.

CO4:Study the effect of temperature on the viscosity of a macromolecule (Protein/DNA).

CO5:Use of viscometry in the study of ligand binding to DNA/protein.

CO6:Crystallization of enzyme lysozyme using hanging drop method.

CO7: Analysis, identification and comparison of various spectra (UV, NMR, MS, IR) of simple organic compounds

CO8:Determination of molar composition of complex

CO9:Determination of indicator constant of an indicator.

CO10: Determination of physico-chemical parameters of water

CO11:Estimation of free fatty acid in oil

CO12:Determination of serum cholesterol

CO13:Estimation of reducing sugar

CO14:Estimation of amino acid by Ninhydrin method

Course Outcomes:

CO15: Estimation of protein by Lowry met

BBM-302 Medical Physics

Course Outcomes:

CO1:Describe the construction and function of the x-ray system.

CO2:Describe the image formation process on radiographic film and digital imaging plates.

CO3:Describe the conversion of a latent x-ray image into a radiologic image.

CO4:Compare and contrast x-ray images with different quality characteristics.

CO5:Describe how x-ray images are developed in a rapid film processor.

CO6:Compare and contrast the basic radiation interactions that occur in matter exposed to x-rays.

CO7:Explain how scattered radiation can affect the film and how its effects can be minimized.

CO8:Recommend methods of improving an x-ray image with deficits.

CO9:Describe the operating characteristics of conventional tomography

be introduced.

CO10: Explain how fluoroscopy differs from conventional overhead radiography

BBM-303 Molecular Biology

Course Outcomes:

CO1:Exhibit a knowledge base in genetics, cell and molecular biology, and anatomy and physiology

CO2:Demonstrate the knowledge of common and advanced laboratory practices in cell and molecular biology **CO3:**Exhibit clear and concise communication of scientific data

CO4:Engage in review of scientific literature in the areas of biomedical sciences

and eukaryotic replication, transcription and translation processes.

CO5:Critique and professionally present primary literature articles in the general biomedical sciences field.

BBM-353 Molecular Biology Lab

Course Outcomes:

CO1: Preparation of various stock solutions required for Molecular Biology Laboratory.

CO2: Preparation of culture medium (LB) for E. coli (both solid and liquid) and raise culture of E. coli.

CO3: Isolation of chromosomal DNA from bacterial cultures and visualization on Agarose Gel Electrophoresis.

CO4: Quantitative estimation of DNA using colorimeter (Diphenylamine reagent) and Spectrophotometer (A260 measurement)

(A260 measurement).

CO5: Isolation of genomic DNA from blood/ tissue.

CO6:Demonstration of Polymerase Chain Reaction (PCR) technique

GBT-301 Microbiology

Course Outcomes:

CO1: Students will be able to acquire, articulate, retain and apply specialized language and knowledge relevant to microbiology.

CO2: Students will acquire and demonstrate competency in laboratory safety and in routine and specialized microbiological laboratory skills applicable to microbiological research or clinical methods, including accurately reporting observations and analysis.

CO3: Students will communicate scientific concepts, experimental results and analytical arguments clearly and concisely, both verbally and in writing.

CO4:Students will demonstrate engagement in the Microbiology discipline through involvement in research or internship activities, the Microbiology Student Association club (MSA) and outreach or mentoring activities specific to microbiology.

GBT-351 Microbiology Lab

Course Outcomes:

CO1: Preparation of different media: synthetic media, Complex media-nutrient agar, Luria Agar.

CO2: Staining methods: Gram's staining, Acid fast staining (permanent slide only), Capsule staining and spore staining.

CO3: Study and plot the growth curve of E coli using turbidometric method and to calculate specific growth rate and generation time.

CO4: To perform antibacterial testing by Kirby-Bauer method.

CO5: Staining and morphological characterization of Aspergillus sp., Pencillium sp. and Saccharomyces sp. **CO6:** Demonstration of PCR based method of detection.

CO7: Isolation of bacteriophages (any with a non-pathogenic host) and calculation of the plaque forming units (pfu)

BBM-451 Pathology Lab Course Outcomes:

CO1: Urine Analysis: Gross examination of urine for colour, odour etc. Abnormal constituents like protein, ketone bodies, glucose, blood, urea (any three)

CO2: Tissue Processing, embedding, sectioning. Staining and preparation of permanent histological slide.

CO3: Study of histological slides showing hypertrophy, hyperplasia, dysplasia, leukemia, cirrhosis and any common cancer.

CO4: Diagnostic tests for detection of various Diseases – CRP, VDRL, RA, Pregnancy, Dengue and HIV (any four)

CO5: Physiological data acquisition like Temperature EEG

CO6: PCR based diagnostics (for any one disease)

CO7: Measurement of Erythrocyte Sedimentation Rate

BBM-402Techniques for Forensic Science

Course Outcomes:

CO1:Demonstrate competency in the collection, processing, analyses, and evaluation of evidence.

CO2:Demonstrate competency in the principles of crime scene investigation, including the recognition, collection, identification, preservation, and documentation of physical evidence.

CO:3Demonstrate an understanding of the scientific method and the use of problem-solving within the field of forensic science.

CO4:Identify the role of the forensic scientist and physical evidence within the criminal justice system.

CO5:Demonstrate the ability to document and orally describe crime scenes, physical evidence, and scientific processes.

CO6:Identify and examine current and emerging concepts and practices within the forensic science field.

BBM-403 Biochemistry

Course Outcomes:

CO1:Demonstrate a broad knowledge of the fundamental introductory concepts of Chemistry, Biology and Physics.

CO2:Demonstrate a thorough knowledge of the intersection between the disciplines of Biology and Chemistry. **CO3:**Demonstrate a proficiency in developing relevant biochemical questions, carrying out laboratory investigations to answer those questions, and critically analyzing, interpreting, and presenting in oral and written form the results of their experiments.

CO4:Locate, critically analyze, interpret and discuss data, hypotheses, results, theories, and explanations found in the primary literature, applying knowledge from Chemistry and Biology.

CO5:Appreciate the way in which practitioners in the disciplines of Biology and Chemistry intersect and bring their expertise to bear in solving complex problems involving living systems.

CO6:Understand the societal impacts, both positive and negative, of science and technology and the limitations of science.

Course Outcomes:

CO1:Handling of laboratory animals.

CO2:Routes of drug administration (Oral, I.M.)

CO3:To study the presence of acetaminophen in given sample.

CO4: To study the stages of general anesthesia.

CO5:To determine partition coefficient of general anesthetics.

CO6:Effect of analgesic (Tail-flick test).

CO7:Anti-anxiety effect of valium (Plus maze test).

CO8:Fixing of organ bath and kymograph.

CO9:To record CRC of acetylcholine using guinea pig ileum / rat intestine.

CO10:Determination of dose ratio.

CO11:Study of competitive antagonism using acetylcholine and atropine.

BMD-502 Radiation Biology

Course Outcomes:

CO1: Describe direct and indirect interactions between radiation and cells.

CO2: Describe the molecular basis of cellular radiosensitivity.

CO3: Explain the influence of cell cycle, repair, repopulation and reoxygenation on tissue radio sensitivity.

CO4: Describe the components of a cell survival curve.

CO5: Given clinical data, draw a cell survival curve.

CO6: Differentiate between cell survival curves of varying LET radiations, hypoxic and aerated cells as well as cell cycle phases.

CO7: Identify the acute and late effects of radiation on living tissue.

CO8: Describe the effects of whole body radiation.

CO9: Describe the long term effects of radiation.

CO10: Explain the effects of radiation on the developing embryo and fetus at each stage.

CO11: Explain the effects of time, dose and fractionation on long term side effects and treatment effectiveness.

CO12:Describe the relationship between LET, RBE and OER.

BMD-502 Radiation Biology Lab

Course Outcomes:

CO1: Microscopy- Theoretical knowledge of Light and Electron microscope.

CO2: To study the following techniques through electron/ photomicrographs: fluorescence microscopy, autoradiography, positive staining, negative staining, freeze fracture, freeze etching shadow casting, endocytosis and phagocytosis.

CO3: To explain mitosis and meiosis using permanent slides.

CO4: To cytochemically demonstrate presence of proteins in cheek cells or onion peel using mercuric bromophenol blue or fast green.

CO5: To cytochemically demonstrate presence of carbohydrates in cheek cells or onion peel using periodic acid Schiff's reagent.

CO6: To cytochemically demonstrate presence of DNA in cheek cells or onion peel using Fulgent reagent.

CO7: To study the effect of isotonic, hypotonic and hypertonic solutions on cells.

CO8: To prepare polytene chromosomes.

BBM-601 Hospital Management

Course Outcomes:

CO1: Understand the need and importance of cost effective sustainable healthcare through demand generation and enhanced quality care

CO2: Develop and apply various employee friendly systems for effective functioning of different administrative activities and support services of hospital

CO3:Promote patient centred care with a continuous quality improvement orientation ensure smooth functioning of core process by forecasting, streamlining patient flow, staff scheduling, planning space/ facilities/ supplies, maintenance, etc.

CO4: Ensure optimum tilization of available limited resources.

CO5: Sharpen managerial skills.

Technology, increased expectations of staff and patients.

CO6: Have an appreciation on the use of information technology in the hospital

BBM-651 Hospital Management Case Studies

Course Outcomes:

CO1:Operational Improvement and Increased Patient Satisfaction at An Urgent Care Center

CO2:Organizational Transformation at A Pediatric Emergency Department

CO3:Integrated Acute Care Lays the Groundwork for Sepsis Bundle Compliance

CO4:Inpatient Throughput Improvements

CO5:Hospitalist Impact on Patient Throughput

CO6: Improving ED Patient Throughput and Achieving Sustainable Outcomes

CO7:Practice Reduces Door-to-Provider Time, Increases Patient Satisfaction

CO8:Implementing the "Comfort Zone" Leads to 97th Percentile Patient Satisfaction

BMD-601 Medical Ethics

Course Outcomes:.

CO1:provide students with the research competencies required to work as professional scholars in bioethics **CO2:**train students in examining and analyzing the salient topics of contemporary healthcare ethics, especially regarding their normative, global and religious dimensions

CO3:provide students with clinical experience through rotations in various clinical settings

CO4: assist student in writing a practical project that qualifies for the professional doctorate

BMD-651 Medical Ethics Case Studies

Course Outcomes:

CO1: A case study based on genetic modified organism (Bt-Cotton).

CO2: A case study based on genetic modified organism (Bt-Brinjal).

CO3: A case study based on terminator seeds.

CO4: A case study based on removal of selective marker in a DNA vaccine.

CO5: A case study on clinical trials of drugs in India with emphasis on ethical issues.

CO6: A case study on women health ethics.

CO7: A case study on medical errors and negligence.

CO8: A case study on critical care ethics.

CO9: A case study on ethical issues in clinical practice of AIDS.

CO10: A case study on handling and disposal of radioactive waste.

B.Sc. in Biomedical Sciences Choice Based Credit System Teaching and Evaluation Scheme Total Program Credit- 140

Duration: 3 Years

SYLLABUS

SHOBHIT INSTITUTE OF ENGINEERINGAND TECHNOLOGY, MEERUT (Deemed to be University) Department of Biomedical Engineering

B.Sc. Biomedical

Overview: B.Sc. Hons. Biomedical Sciences concerns with the topics to understand the biological principles that govern the functioning of the human body, to discover the mechanisms of any disease and to find new and distinct ways to cure a disease by developing advanced diagnostic tools or new therapeutic strategies. The B.Sc. (Hons) Biomedical Science started as an interdisciplinary course at Shobhit University, Meerut. It is the applied domain of life and natural sciences, used for diagnosis, prevention and treatment of human diseases. This course is suited for those students who are desirous of teaching at the college level. Students should have skills like identifying blood groups, interpreting results and liaising with medical staff, maintaining records and writing medical reports to seek admission to B.Sc. Hons. (Biomedical Sciences).

Program Outcome: Bachelor of Science (B.Sc.) offers theoretical as well as practical knowledge about different subject areas. These subject areas include Physics, Chemistry, Mathematics and Biology and other fields depending on the specialization a student opts. This programme course is most beneficial for students who have a strong interest and background in Science and Mathematics. The course is also beneficial for students who wish to pursue multi and inter-disciplinary science careers in future. Following are the various programme outcomes:

POs:

- 1 **Scientific knowledge:** Apply the knowledge of physics, chemistry, biology, zoology and mathematics to the solution of complex scientific problems.
- 2 Problem analysis: Identify, formulate, review research literature, and analyse complex Scientific problems reaching substantiated conclusions using first principles of physics, chemistry, biology, zoology and mathematics
- 3 **Design/development of solutions:** Design solutions for complex problems or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
- 4 **Conduct investigations of complex problems:** Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.

- 5 **Modern tool usage:** Create, select, and apply appropriate techniques, resources, and modern science and tools including prediction and modeling to complex scientific activities with an understanding of the limitations.
- 6 **The science and society:** Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional scientific practice.
- 7 Environment and sustainability: Understand the impact of the professional science solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
- 8 **Ethics:** Apply ethical principles and commit to professional ethics, responsibilities, and norms of the scientific practice.
- 9 **Individual and teamwork:** Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
- 10 **Communication:** Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
- 11 **Project management and finance:** Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
- 12 Life-long learning: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

Programme Specific Outcome:

PSO1. It helps to develop scientific temper and thus can prove to be more beneficial for the society as the scientific developments can make a nation or society to grow at a rapid pace. Science graduates can go to serve in industries or may opt for establishing their own industrial unit.

PSO2. After the completion of this course students have the option to go for higher studies i.e. M. Sc and then do some research for the welfare of mankind. After higher studies, students can join as scientist and can even look for professional job oriented courses.

PSO3. This course also offers opportunities for serving in Indian Army, Indian Navy, Indian Air Force as officers. Students after this course have the the option to join Indian Civil Services as IAS, IFS etc.

Eligibility Criteria:

B.Sc. Hons. Biomedical Sciences is a highest demanding program nowadays and as per experts it's been said that it is a job-oriented Bachelor's degree program which is of 3-years duration. Students who have passed Class 12 examination with Physics, Chemistry and Biology/ Mathematics or Both as compulsory subjects can pursue this program.

Total					140

Course Code	Course name	Course of	utcomes
		Semester 1	[
BBM- 101	Human Anatomy and Physiology	CO1	Label the functions of the human anatomy and physiology from a regional perspective for the following regions and systems: a. Head and neck, thoracic, abdominopelvic, and upper and lower extremities, Major skeletal muscles, their actions, origins, insertions, and peripheral nerves, Central nervous system and plexuses, Respiratory system, Cardiovascular/hematologic system. Identify the major structures of the human anatomy for the following: a. Head and neck, thoracic, abdominopelvic, and upper and lower extremities. Major skeletal muscles, their actions, origins, insertions, and peripheral nerves, Central nervous system and plexuses d. Respiratory system, Cardiovascular/hematologic system.
		CO3	Identify the major bones and their processes as they relate to each region of the body.
		CO4	Tell briefly the basic components and functions of the gastrointestinal, renal/urinary, endocrine/metabolic, hepatic/biliary, genital/reproductive and immunologic, systems.
		CO5	Identify the findings from a simulated healthcare record such as electrocardiogram data and pulmonary ventilation outcomes.

		CO1 CO2	 Know and recall the fundamental principles of organic chemistry that include chemical bonding, nomenclature, structural isomerism, stereochemistry, chemical reactions and mechanism. Name the functional groups and different class of organic compounds. Recognize the basic practical skills for the synthesis and analysis of organic compounds.
BBM- 102	Organic Chemistry	CO3	Predict the reactivity of an organic compound from its structure; Develop basic skills for the multi-step synthesis of organic compounds; Justify a reasonable mechanism for a chemical reaction.
		CO4	Demonstrate ability to work independently as well as within a team
		CO5	Manage resources and time and get along well with other members of the group.
GBT- 101	Basic Cell Biology	CO1	Understand information about cells, including their composition, their function and cell-cycle checkpoints. The module on radiation biology will help to explore and gain insight into radiation-induced biological responses at

			molecular, cellular and tissue levels.
		CO2	Students will understand the structures and purposes of basic components of prokaryotic and eukaryotic cells, especially macromolecules, membranes, and organelles
		CO3	Students will understand how these cellular components are used to generate and utilize energy in cells.
		CO4	Students will understand the cellular components underlying mitotic cell division.
		CO5	Students will apply their knowledge of cell biology to selected examples of changes or losses in cell function. These can include responses to environmental or physiological changes, or alterations of cell function brought about by mutation.
		Semester: I	Ι
		CO1	Explain basic electrophysiology mechanism involve in bio-potential generation.
BBM-	Diagnostic and Therapeutic Instrumentation	CO2	explain the working of patient monitoring system, diagnostic and therapeutic equipments
201		CO3	Examine the bioelectrical and non-bioelectrical activities.
		CO4	Calibrate and handle the equipments related to the patient care and monitoring.

		CO5	Students will know the definitions, basic principles and the applications of the available diagnostic and therapeutic devices
		CO1	Trace the history and development of immunology.
		CO2	Distinguishes between self and foreign molecules and thus alerts and mediates protection against attack by potentially infectious organisms. Also, describe surface membrane barriers and their protective functions, importance of phagocytosis and natural killer cells in innate body defense.
BBM- 202	Immunology	CO3	Describe the roles of different types of T cells, B cells and APCs. Compare and contrast the origin, maturation process, and general function of B and T lymphocytes.
		CO4	Malfunctioning of the immune system leads to a number of disorders and diseases. Understanding the biology of the immune system is, therefore, key to developing strategies towards prevention and cure to a number of disorders and diseases that result due to interference in the functioning and regulation of the immune system.
GBT- 201	Principles of Genetics	CO1	Discussing the progression of discovery from Classical to Modern Genetics, Defining basic concepts of Classical Genetics, Describing Mendel's experimental design, Utilizing conventional Mendelian genetic terminology, Explaining Mendel's principles of segregation, and independent assortment.

		CO2 CO3	Solving monohybrid cross genetic outcomes utilizing branch diagrams and/or Panetta squares, Using testcrosses to identify parental genotype and confirm the principle of segregation. Solving dihybrid cross genetic outcomes utilizing branch diagrams and/or Punnett squares. Analyzing the results of multihybrid crosses to confirm the principle of Independent Assortment.
		CO4	Using the laws of probability to statistically analyze the outcomes of genetic crosses.
	 !	Semester II	I
BBM-301	Analytical Instrumentation and its Applications	CO1	Strategically plan analytical campaigns to apply to different types of samples and research objectives, including selection of the most appropriate technique/instrumentation for the students' research project.
		CO2	Undertake the correct sample preparation and characterization prior to analysis by the chosen techniques or instruments.
		CO3	Design an analytical work-flow to acquire data and achieve the research objectives of their project.
		CO4	Process data from the chosen instruments and demonstrate understanding of the limitations and quality of the data. Justify the approach taken to data processing.
		CO5	Write a clear and concise justification and description of the analytical techniques

			employed, suitable for publication in a scientific
			journal.
BBM-302	Medical Physics	CO1	Describe the construction and function of the x-
			ray system, describe the image formation process
			on radiographic film and digital imaging plates.
		CO2	Describe the conversion of a latent x-ray image
			into a radiologic image, Compare and contrast x-
			ray images with different quality characteristics.
		CO3	Describe how x-ray images are developed in a
		003	
			rapid film processor, Compare and contrast the
			basic radiation interactions that occur in matter
			exposed to x-rays.
		CO4	Explain how scattered radiation can affect the
			film and how its effects can be minimized,
			Recommend methods of improving an x-ray
			image with deficits. Describe the operating
			characteristics of conventional tomography
		CO5	Explain how fluoroscopy differs from
			conventional overhead radiography
BBM-303	Molecular Biology	CO1	Exhibit a base in genetics, knowledge on basic
			molecular Biology understanding of the execution
			of central dogma, and anatomy and physiology.
			Knowledge on the basic organization of the
			genome in prokaryotes and eukaryotes, on
			prokaryotic and eukaryotic replication,
			transcription and translation processes along with
			their discerning features.
		CO2	Demonstrate the knowledge of common and

		CO3	advanced laboratory practices in cell and molecular biologyExhibit clear and concise communication of scientific dataEngage in review of scientific literature in the areas of biomedical sciences, Critique and
			professionally present primary literature articles in the general biomedical sciences field
GBT-301 Microbiology	Microbiology	CO1	Student will understand the microbial structure, growth and development, methods and role of sterilization in the context of study of microbes, the pathogenic microbes and the diseases caused by them, also focus on mechanisms of microbial pathogenesis and the host response, and the scientific approaches to investigate pathogenesis processes and emerging antimicrobial resistance.
		CO2	Students will be able to acquire, articulate, retain and apply specialized language and knowledge relevant to microbiology.
		CO3	Students will acquire and demonstrate competency in laboratory safety and in routine and specialized microbiological laboratory skills applicable to microbiological research or clinical methods, including accurately reporting observations and analysis.
		CO4	Students will communicate scientific concepts, experimental results and analytical arguments

		CO5	clearly and concisely, both verbally and in writing. Students will demonstrate engagement in the Microbiology discipline through involvement in research or internship activities, the Microbiology Student Association club (MSA) and outreach or mentoring activities specific to microbiology.
SBM-301	Biocomputation	CO1 CO2	Student will understand basic Computational biology and bioinformatics, various databases and their classification Students would be able in Sequence alignment
		CO3	and visualization and Phylogenetic and microarray analysis Student will understand the discipline of
			computational biology and drug design, the different aspects of nucleotide and protein sequence analyses, sequence alignments and their applications in understanding biology.
		CO4	Students will understand the basic strategic issues in drug discovery and development, principles of computational methods involved in lead generation virtual screening, quantitative structureactivity relationship and molecular docking.

Semester-I	V		
BBM- 401	Pathology	CO1	Basic understanding of diseases and their pathogenesis, the topics are of introductory nature and build the concepts of how human system work in altered and diseased stage under the influence of various internal and external stimuli
		CO2	Describe topics like cellular adaptations, inflammation, neoplasia, cellular ageing and other infectious diseases.
		CO3	Get knowledge on laboratory exercises to substantiate and clarify the theoretical concepts.
		CO4	Upon successful completion of this course unit, the student should comprehend the general principles of disease and of biological and genetic processes involved in cancer development. The student should also be able to describe the most important diseases of selected organs.
BBM-402	Techniques for Forensic Science	CO1	Demonstrate competency in the collection, processing, analyses, and evaluation of evidence.
		CO2	Demonstrate competency in the principles of crime scene investigation, including the

			recognition, collection, identification,
			preservation, and documentation of physical
			evidence.
			evidence.
		CO3	
			Demonstrate an understanding of the scientific
			method and the use of problem-solving within the
			field of forensic science.
		CO4	Identify the role of the forensic scientist and
		04	•
			physical evidence within the criminal justice
			system.
		CO5	Demonstrate the ability to document and orally
			describe crime scenes, physical evidence, and
			scientific processes. Identify and examine current
			and emerging concepts and practices within the
			forensic science field.
BBM-403	Biochemistry	CO1	Demonstrate a broad knowledge of the
			fundamental introductory concepts of Chemistry,
			Biology and Physics.
		CO2	Demonstrate a thorough horough the first
		CO2	Demonstrate a thorough knowledge of the
			intersection between the disciplines of Biology
			and Chemistry.
		CO3	Demonstrate a proficiency in developing relevant
			biochemical questions, carrying out laboratory
			investigations to answer those questions, and

		CO4	critically analyzing, interpreting, and presenting in oral and written form the results of their experiments. Locate, critically analyze, interpret and discuss data, hypotheses, results, theories, and explanations found in the primary literature, applying knowledge from Chemistry and Biology.
		CO5	Appreciate the way in which practitioners in the disciplines of Biology and Chemistry intersect and bring their expertise to bear in solving complex problems involving living systems. Understand the societal impacts, both positive and negative, of science and technology and the limitations of science.
GBT-401	Toxicology	CO1	Critically evaluate different advanced exposure assessment methods
		CO2	Design strategies for exposure assessment
		CO3	Analyse and interpret exposure measurements applying different modelling tools (stochastic and deterministic)

		CO4	Characterize measurement error and its consequences
		CO5	Appreciate the advantages and disadvantages of toxicological and epidemiological studies for deriving dose-response relationships
SBM-401	Biostatistics	CO1	Student will understand statistical data analyses that come from deliberate experiment, the data collected from the population in the course of public health study and survey.
		CO2	Students will get training on how to conduct epidemiological surveys, design questionnaire and analyze the data. The students will get hands- on-training on 'R', a free software environment for statistical computing and graphics.
		CO3	use and interpret results of descriptive statistical methods effectively.
		CO4	Explain the principal methods of statistical inference and design.
		CO5	Read and learn new statistical procedures independently.
	·	Semester-V	7
BBM-501	Medicinal Chemistry	CO1	Correlating between pharmacology of a disease and its mitigation or cure.

		CO2	Understanding the drug metabolic pathways,
			adverse effect and therapeutic value of drugs.
		CO3	Knowing the structural activity relationship of different class of drugs.
		CO4	Well acquainted with the synthesis of some important class of drugs.
		CO5	Knowledge about the mechanism pathways of different class of medicinal compounds. 6. To understand the chemistry of drugs with respect to their pharmacological activity.
BBM-502	BBM-502 Medical Biotechnology	CO1	Students will understand infections caused by different bacteria and viruses, and learn the basic techniques and methods used in the diagnosis and therapy of various human diseases and in the production of biopharmaceuticals,
		CO2	Understand the concepts of cloning and expression of the desired gene. Students will understand how biological systems are applied in the advancement of medical biotechnology

		CO3	Develop an understanding of the Cytoskeleton and Cell Membrane.
		CO4	Discuss the structure of Microtubules, microfilaments.
BMD- 501	Pharmacology	CO1	Identify the fundamental principles of pharmacokinetics and pharmacodynamics.
		CO2	Apply the pharmacodynamic and pharmacokinetic principles that describe drug actions in humans.
		CO3	Compare and contrast the specific pharmacology of the major classes of drugs, important distinctions among members of each class, the risks and benefits, in relation to the organ systems they affect, and the diseases for which they are used therapeutically.
		CO4	Identify the role of molecular genetics and genomic principles in pharmacotherapeutics and drug development.
BMD- 502	Radiation Biology	CO1	Describe direct and indirect interactions between radiation and cells, describe the molecular basis of cellular radio sensitivity.
		CO2	Explain the influence of cell cycle, repair, repopulation and reoxygenation on tissue radio sensitivity, describe the components of a cell

	survival curve, given clinical data, draw a cell survival curve.
CO3	Differentiate between cell survival curves of varying LET radiations, hypoxic and aerated cells as well as cell cycle phases, Identify the acute and late effects of radiation on living tissue.
CO4	Describe the effects of whole body radiation, describe the long term effects of radiation, explain the effects of radiation on the developing embryo and fetus at each stage.
CO5	Explain the effects of time, dose and fractionation on long term side effects and treatment effectiveness, describe the relationship between LET, RBE and OER

Semester: VI

BBM-	Hospital Management	CO1	Understand the need and importance of cost
601			effective sustainable healthcare through demand generation and enhanced quality care
		CO2	Develop and apply various employee friendly systems for effective functioning of different administrative activities and support services of
			hospital.

		CO3	Promote patient centred care with a continuous quality improvement orientation ensure smooth functioning of core process by forecasting, streamlining patient flow, staff scheduling, planning space/ facilities/ supplies, maintenance, etc.
		CO4	Ensure optimum tilization of available limited resources, Sharpen managerial skills. Have an appreciation on the use of information technology in the hospital
BMD- 601	Medical Ethics	CO1	Provide students with the research competencies required to work as professional scholars in bioethics
		CO2	train students in examining and analyzing the salient topics of contemporary healthcare ethics, especially regarding their normative, global and religious dimensions
		CO3	provide students with clinical experience through rotations in various clinical settings
		CO4	assist student in writing a practical project that qualifies for the professional doctorate
BMD- 602	IPR	CO1	Students will understand the need for creation, protection, and commercialization of intellectual property in the area.

		CO2	Knowledge on various forms of Intellectual Property Rights, deals with the entire process of patent filling and taking some case studies.
		CO3	The students once they complete their academic projects, they get awareness of acquiring the patent and copyright for their innovative works.
		CO4	They also get the knowledge of plagiarism in their innovations which can be questioned legally.
BBM- 671	Project Work	CO1	Student will understand how to connect the theoretical knowledge with actual practical things.
		CO2	Student will get a clear explanation of how the project works address to solve the Statement of a Problem. Student will get a perfect training a on research domain.

Pre- requisites (if any)	Basic knowledge of			Ŭ				
Objectives	analytical branche understand inherit inheritance. The c development of th deviate from Men way they have con forward genetics h that is applicable will be at the in	Genetics having its roots in mathematics thanks to Mendel, appeals to students as one of the analytical branches of biology even in senior school. Basic concepts that are essential to understand inheritance will be taught, starting from the abstract factors to physical basis of inheritance. The course aims to communicate the pivotal role of Mendelian concepts in the development of the science of genetics and also the fact that nature is full of examples that deviate from Mendelian laws starting from linkage groups. Introduction of models and the way they have contributed to our understanding of genetics will provide a perception of how forward genetics has been used to understand the basis of continuity of information transfer that is applicable to not only to the simple life forms but also to humans. Most of the topics will be at the introductory level, which would motivate the students to understand the						
Outcomes	 molecular basis of genotype to phenotype correlation. The student will demonstrate knowledge of the basics principles of Mendelian genetics by: Discussing the progression of discovery from Classical to Modern Genetics. Defining basic concepts of Classical Genetics. Describing Mendel's experimental design. Utilizing conventional Mendelian genetic terminology. Explaining Mendel's principles ofsegregation, and independent assortment. Solving monohybridcross genetic outcomes utilizing branch diagrams and/or Punnett squares. Using testcrosses to identify parental genotype and confirm the principle ofsegregation. Solving dihybrid cross genetic outcomes utilizing branch diagrams and/or Punnett squares. Analyzing the results of multihybrid crosses to confirm the principle of Independent Assortment. Using the laws of probability to statistically analyze the outcomes of genetic crosses. 							
Unit I	crossing over, ch	romos two	omal point	theory test c	y of inheritance, Mendelian ratio, linkage, y of inheritance. Chromosome mapping: ross, three point test cross, interference, analysis.	08		
Unit II	Structural and numerical changes in chromosomes: Chromosomal aberration (deletion, duplication, translocation and inversion), euploidy and aneuploidy, aneuploidy in human. Mutations: Natural and induced mutations, physical and chemical mutagens, Ames test, uses of mutations in genetic studies, human health and crop improvement. Biochemical and microbial genetics:Neurospora as model system, one gene one enzyme hypothesis.08							
Unit III	Sex determination: Sex linked inheritance, determination of sex and dosages compensation. Chloroplast and mitochondrial genetics: Cytoplasmic inheritance, chloroplast inheritance in plants, mitochondrial genes in yeast.							
Unit IV	Phenyl ketonuria, disease, Cystic fib	Alkap risis, g	otonuri enetic	a, Alt couns		08		
Unit V	Population and e Weinberg law, in	volution breeding	ng, gei	geneti netic (cs: Gene pool and gene frequencies, Hardy- equilibrium, genetic basis of evolution and ation of multigene families.	08

Objectives	interdisciplinary f applied to underst organisms and en This paper cover biophysics and in basic cellular func	Biological phenomena cannot be understood fully without physical insight. Biophysics is an interdisciplinary frontier of science in which the principles and techniques of physics are applied to understand biological problems at every level, from atoms and molecules to cells, organisms and environment. The work always aims to find out how biological systems work. This paper covers various spectroscopic techniques, hydrodynamic methods, molecular biophysics and introduction to various physical principles responsible for maintaining the basic cellular function and integrity of biological membranes including transport across them.						
Outcomes	 Students would be able to: Strategically plan analytical campaigns to apply to different types of samples and research objectives, including selection of the most appropriate technique/instrumentation for the students' research project. Undertake the correct sample preparation and characterization prior to analysis by the chosen techniques or instruments. Design an analytical work-flow to acquire data and achieve the research objectives of their project. Process data from the chosen instruments and demonstrate understanding of the limitations and quality of the data. Justify the approach taken to data processing. Write a clear and concise justification and description of the analytical techniques employed, suitable for publication in a scientific journal. 							
Unit I	Principle, Instrumentation and analytical applications of following techniques Atomic Absorption spectroscopy , Flame photometry, Inductively coupled plasma-Atomic Emission spectroscopy , Scanning Electron Microscopy							
Unit II	Chromatography : Gas solid Chromatography , Gas liquid Chromatography, High performance liquid chromatography, ion exchange chromatography, paper chromatography, thin layer chromatography, column chromatography, gel permeation chromatography 08					08		
Unit III	Radioanalytical methods : Neutron activation analysis, isotope dilution analysis, 08 Radiometric titrations, particle induced X-ray Emission, Use of radioisotopes - in industry, agriculture and physicochemical studies .							
Unit IV	Spectroscopic Techniques U V Introduction to spectroscopy, Lambert Beer's law, Deviation from Lambert Beer's law, instrumentation and applications IR Introduction, basic principles, factors affecting IR group frequencies , Instrumentation and Applications08							
Unit V	NMR Basic principles, elementary ideas and instrumentation chemical shifts, spin-spin coupling, instrumentation and applications Mass Spectroscopy: Introduction, basic principles, applications and uses ESR: Principle, instrumentation and applications X-ray Spectroscopy: X-ray absorption, methods, diffraction methods Raman Spectroscopy : Principle instrumentation and applications 08

- 1. Effect of different solvents on UV absorption spectra of proteins.
- 2. Study of structural changes of proteins at different pH using UV spectrophotometry.
- **3.** Study of structural changes of proteins at different temperature using UV spectrophotometry. 4. Determination of melting temperature of DNA.
- 4. Study the effect of temperature on the viscosity of a macromolecule (Protein/DNA).
- 5. Use of viscometry in the study of ligand binding to DNA/protein.
- 6. Crystallization of enzyme lysozyme using hanging drop method.
- 7. Analysis, identification and comparison of various spectra (UV, NMR, MS, IR) of simple organic compounds
- 8. Determination of molar composition of complex
- 9. Determination of indicator constant of an indicator.
- 10. Determination of physico-chemical parameters of water
- **11.** Estimation of free fatty acid in oil
- **12.** Determination of serum cholesterol
- **13.** Estimation of reducing sugar
- **14.** Estimation of amino acid by Ninhydrin method
- **15.** Estimation of protein by Lowry met

Course title	Techniques for Forensic Science						
Scheme and Credits	Credit 4	L 4	T	P 0			
Pre- requisites (if any)	4 None						
Objectives	law. Interest in for the present forensi work, the tools an court. This engage	Forensic science is the application of scientific knowledge to questions of civil and criminal law. Interest in forensic science has grown considerably in recent years. Keeping this in view, the present forensic science course is designed for students to explore how forensic scientist's work, the tools and techniques they use and how they reach the conclusions they present in court. This engage students in using a creative, problem solving and inquiry based approach to investigate the crime scene. It also explains the characteristics of a fingerprint collect, process,					
Outcomes	 At the completion of the Forensic Science Technology student will be able to: Demonstrate competency in the collection, processing, analyses, and evaluation of evidence. Demonstrate competency in the principles of crime scene investigation, including the recognition, collection, identification, preservation, and documentation of physical evidence. Demonstrate an understanding of the scientific method and the use of problem-solving within the field of forensic science. Identify the role of the forensic scientist and physical evidence within the criminal justice system. Demonstrate the ability to document and orally describe crime scenes, physical evidence, and scientific processes. Identify and examine current and emerging concepts and practices within the forensic science field. 						
Unit I	Crime Scene Investigation :Introduction and principles of forensic science,08Forensic science laboratory and its organization and service, tools and techniquesin forensic science, branches of forensic science, causes of crime, role of modusoperandi in criminal investigation				08		
Unit II	Types of injuries and death : Classification of injuries and their medico-legal aspects, method of assessing various types of deaths, Case studies to depict different types of injuries and death. 08						
Unit III	Forensic chemistry and Ballistics: Classification of fire arms and explosives, introduction to internal, external and terminal ballistics. Chemical evidence for explosives. 08						
Unit IV	Forensic Graphology: General and individual characteristics of handwriting, examination and comparison of handwritings and analysis of ink various samples.08Forensic Toxicology Role of the toxicologist, significance of toxicological findings10						
Unit V	Fingerprint analysis: Fundamental principles of fingerprinting, classification of fingerprints, development of finger print as science for personal identification, Principle of DNA fingerprinting, application of DNA profiling in forensic medicine. Cyber Forensic Investigation08

	Core Biomedical						
Course title	Toxicology						
Scheme and	Credit	L	Т	Р			
Credits	4	4	0	0			
Pre- requisites (if any)	None						
Objectives	Different types of poisons have been known to humans since ages. Even in early times when science was in its infancy, curious people such as "Paracelsus" could predict "Every substance is a poison and, it is the right dose of the substance which differentiates remedy from poisons". This thought is fundamental even to modern toxicology and pharmacology. There is an increasing use of chemicals in the modern society and hence, toxicology is becoming a more important subject to study with the passage of time. Modern toxicology is a vast, multidisciplinary subject encompassing various other basic fields of science. The present course content is designed to provide the basics of toxicology. Relevant importance has been given to those topics which can build a strong foundation in the subject, based on which, facts can be assimilated during subsequent higher studies.						
Outcomes	 Student would be able to: 1. Critically evaluate different advanced exposure assessment methods 2. Design strategies for exposure assessment 3. Analyse and interpret exposure measurements applying different modelling tools (stochastic and deterministic) 4. Characterize measurement error and its consequences 5. Appreciate the advantages and disadvantages of toxicological and epidemiological studies for deriving dose-response relationships 						
Unit I	classification of significance. Effe xenobiotics on its	toxic ect of toxici	sub durati ty. Ch	stance ion, f aracte	Different areas of modern toxicology, s, various definitions of toxicological requency, route and site of exposure of ristic and types of toxic response. Types of xenobiotics exposure in humans. Tolerance	08	
Unit II	Evaluation and mechanism of toxicity: Various types of dose response08relationships, assumptions in deriving dose response, LD50, LC50, TD50 and therapeutic index. Delivery of the toxicant, mechanisms involved in formation of ultimate toxicant, detoxification of ultimate toxicant.08				08		
Unit III	Xenobiotics and	toxic a kenobio	gents	I	Absorption, Distribution, Excretion and nsformation, Phase- I reactions including	08	
Unit IV	Reductions and phase II conjugation reactions).Toxic insult to liver, its susceptibility to toxicants with reference to any two hepatotoxicants.Human exposure, mechanism of action and resultant toxicities of the following xenobiotics: Metals: lead, arsenic, Pesticides: organophosphates, carbamates, organochlorine, bipyridyl compounds and anticoagulant pesticides.						
Unit V	 co-toxicology and Clinical toxicology Brief introduction to avian and aquatic toxicology, movement and effect of toxic compounds in food chain (DDT, mercury), bioaccumulation, biomagnification, acid rain and its effect on ecosystems, concept of BOD and COD. Management of poisoned patients, clinical methods to decrease absorption and enhance excretion of toxicants from the body use of antidotes. 						
Course code	GBT-451					CR.	
Course title	Toxicology Lab.					2.0	

1. Separation of a mixture of benzoic acid, beta- napthol and napthelene by solvent extraction and identification of their functional Groups.

2. Determination of Dissolved oxygen (DO) using Winkler's method.

3. Determination of Biological oxygen demand (BOD) of water.

4. To perform quantitative estimation of residual chlorine in water samples.

- 5. To determine the total hardness of water by complexo-metric method using EDTA.
- 6. To determine acid value of the given oil sample.
- 7. To estimate formaldehyde content of given sample.

8. Calculation of LD50 value of an insecticide from the data provided.

9. Determination of COD (chemical oxygen demand) of the given water sample.

Category	Skill Enhancement						
Course title	Biostatistics						
Scheme and Credits	Credit	L	Т	Р			
	4	4	0	0			
Pre- requisites (if any)	None						
Objectives	In public health work, one may be concerned with planning of experiments and the analysis of their results. Therefore, one has to deal with statistical data analyses that come from no deliberate experiment but that arise because of the data collected from the population in the course of public health study and survey. This course therefore provides training to the students on how to conduct epidemiological surveys, design questionnaire and analyze the data. The students will get hands-on-training on 'R', a free software environment for statistical computing and graphics.						
Outcomes	 After the completion of this course students would be able to: 1. use and interpret results of, descriptive statistical methods effectively. 2. Explain the principal methods of statistical inference and design. 3. Read and learn new statistical procedures independently. 						
Unit I	Descriptive Statistics Data in Biology: Development in biostatistics, samples and populations, techniques of sampling (random and stratified), sampling and non-sampling errors, variables in biology, accuracy, precision, univariate and bivariate frequency distributions and their graphical representations. Measures of Central Tendency: Arithmetic means, mode, median and partition values.						
Unit II	Measures of Dispersion: Range, standard deviation, coefficient of variance and covariance.08Moments: Raw and central moments and their relationships. Measures of Skewness: Pearson''s and Bowley''s coefficients of skewness, Measures of Kurtosis.08						
Unit III	Correlation Analysis: Pearson"s and Spearman"s coefficients of correlation, coefficient of determination, standard and probable errors. 08						
Unit IV	Regression Analysis: Method of least squares, equations of lines of regression 08 and their applications in biostatistics.						
Unit V	Probability and Probability DistributionsProbability: Basic concepts, addition08and multiplication rules of probability, conditional probability, Bayes" theoremand its applications in biostatistics.						
References	 and its applications in biostatistics. Cassarett and Doull''s Toxicology "The Basic Science of The Poisons" 7th edition (2008), Curtis D. Klaassen Editor, McGrawHill Medical. Pre- requisites (if any)	None							
Objectives	The course highlights the importance of Medicinal Chemistry in all our lives and the fascination of working in a field that overlaps the disciples of chemistry, biology, biochemistry, pharmacology etc. It gives brief understanding about drug-receptor interactions, lead discovery, drug design and molecular mechanism by which drug act in the body. The course emphasizes on various drug targets in the body and drug development strategies with mechanism of action of antibacterial agents and concept of drug resistance.							
Outcomes	 completion of this course will be helpful in 1. Correlating between pharmacology of a disease and its mitigation or cure. 2. Understanding the drug metabolic pathways, adverse effect and therapeutic value of drugs 3. Knowing the structural activity relationship of different class of drugs. 4. Well acquainted with the synthesis of some important class of drugs. 5. Knowledge about the mechanism pathways of different class of medicinal compounds. 6. To understand the chemistry of drugs with respect to their pharmacological activity. 							
Unit I	Drug discovery and drug development Introduction to drug discovery and 08 development; Identification of disease, drug target, bioassay; methods of screening of lead compounds; isolation and purification; structure determination; structure-activity relationships; pharmacophore identification; target oriented drug design; pharmacokinetic drug design; drug metabolism; toxicity testing; clinical trials; patents.							
Unit II	Drug targets and action/Pharmacodynamics Drug targets and actions on lipids and carbohydrates; drug actions on proteins – Structure of proteins, drug action at proteins, peptides and proteins as drugs; drug actions on enzymes- Enzymes as catalysts, types of drug binding at active site, enzyme kinetics of drugs interaction, medicinal uses of enzyme inhibitors; drug action at receptors- Role of receptors, conformational changes in receptors, design of agonists and antagonists, partial agonists, inverse agonists, desensitization and sensitization; drug actions on nucleic acids- Nucleic acids structure, drugs acting on DNA and RNA.							
Unit III	Drug targets and action/Pharmacokinetics Drug distribution and survival; pharmacokinetic issues in drug design; drug dose levels; solubility, membrane permeability, hydrolysis and metabolism in drug design; Prodrugs and its importance in drug design; Routes of drug administration; Synergism in drug design.							
Unit IV	Molecular Modelling Quantitative structure activity relationships – Graphs and equations, physicochemical properties, Hansch equation, Craig plot, Topliss Scheme, Bioisosteres, 3D QSAR; Combinatorial synthesis – drug optimization and drug discovery, Methods of combinatorial synthesis – Solid phase techniques, parallel synthesis techniques, mixed combinatorial synthesis techniques, deconvolution, methods of structure determination of active compounds, planning08							
Unit V	and designing a combinatorial synthesis, activity testing, limitations.Image: Computing in drug design Molecular and quantum mechanics; drawing and viewing chemical structures; 3D structures; Energy minimization; Molecular dimensions and properties; Conformational analysis; Structure comparisons and identification of active conformations; Pharmacophore identification; Docking techniques; Databases screening and handling for lead compounds; Receptor mapping; <i>De Novo</i> designing; Case study08

Pre- requisites (if any)	None				<u> </u>			
Objectives	The unique preposition of this paper is that the students learn the basic techniques and methods used in the diagnosis and therapy of various human diseases and in the production of biopharmaceuticals. The concepts of cloning and expression of the desired gene is explored. This paper aims to train students to understand how biological systems are applied in the advancement of medical biotechnology							
Outcomes	 By the end of the course the student will be able to: Develop an understanding of the Cytoskeleton and Cell Membrane. Discuss the structure of Microtubules, microfilaments. Understand infections caused by different bacteria and viruses. 							
	Introduction to N	/ledics	l Biot	echno	logy Brief history and Importance. Agarose	08		
Unit I	Introduction to Medical Biotechnology Brief history and Importance, Agarose gel electrophoresis, Southern and Western blotting and hybridization, use of enzymatic and chemiluminiscent methods for detection of proteins, preparation of labeled probes.							
Unit II	Manipulation of DNA and Cloning Vectors Isolation and purification of genomic and plasmid DNA, Restriction and modification systems, type I-IV restriction endonucleases, nomenclature and sequence recognition, restriction mapping. Joining of DNA molecules: role of DNA ligase, adaptors, linkers, homopolymer tailing , Basic biology of plasmids, Plasmid vectors (pBR322 and pUC vectors, T-vectors) and phage vectors (Bacteriophage vectors- replacement and insertion vectors), cosmids, in vitro packaging, expression vectors, example of prokaryotic and eukaryotic expression vectors, inducible and constitutive							
Unit III	expression vectors with one example each.08Cloning and expression of cloned genes in prokaryotic and eukaryotic Cells Challenges in expression of foreign proteins in heterologous host, factors affecting the expression host cell physiology, promoters, codon choice, plasmid copy no. etc., expression in eukaryotic cells (yeast), Shuttle vectors, Bacterial transformation and selection and screening of transformants (blue/white and antibiotic selection methods). Principle and applications, primer-design, detailed understanding of PCR and RT- (Reverse transcription) PCR.08							
Unit IV	Construction of genomic and cDNA libraries, screening and selection of recombinants08recombinantsImmunochemical methods of screening, nucleic acid hybridization (Colony and Plaque hybridization), different methods of preparation of gene probe. Hybrid Release Translation and Hybrid Arrest Translation. Methods in Random mutagenesis: any two, methods in Site-directed mutagenesis: oilgonucleotide-directed mutagenesis, PCR-based method, screening and identification of mutants. Protein engineering concept and examples of Subtilisin, and alpha-Antitrypsin (AAT)							
Unit V	Application of Medical Biotechnology(a) Production of recombinant08biomolecules: Insulin, somatostatin, Factor VIII and interferons. (b) DNAProfiling: Introduction, DNA profiling based on STRs, minisatellites, RFLP,08AFLP, VNTRs, SNPs and their applications. (c) Gene Therapy: Strategies andlimitations, somatic and germline gene therapy, different vectors (viral and non viral) and their comparison, treatment for genetic and infectious diseases.08							
Course code	BBM-552

Pre- requisites (if any)	Medicinal Chemis	stry and	l Medi	cal Bi	otechnology						
Objectives	Pharmacology is the science concerned with the study of drugs and how they can best be used in the treatment of disease in both humans and animals. The course starts with the general considerations and lead to understanding of various drugs acting on different body systems. It is a very important biomedical discipline, with roots both in basic biology and chemistry, and plays a vital role in helping to safeguard our health and welfare.										
Outcomes	 Identify the fur the pharmacodyna Compare and c distinctions amon systems they affect Identify the role 	By the end of this course, each student should be able to: 1. Identify the fundamental principles of pharmacokinetics and pharmacodynamics. 2. Apply the pharmacodynamic and pharmacokinetic principles that describe drug actions in humans. 3. Compare and contrast the specific pharmacology of the major classes of drugs, important distinctions among members of each class, the risks and benefits, in relation to the organ systems they affect, and the diseases for which they are used therapeutically. 4. Identify the role of molecular genetics and genomic principles in pharmacotherapeutics and drug development.									
Unit I					and Source of drugs, Routes of drug receptor and receptor subtypes.	08					
Unit II	Pharmacokinetics and PharmacodynamicsDrugabsorption,distribution, metabolism, and excretion, bioavailability, First Pass metabolism, excretion and kinetics of elimination, Bioavailability, Biological half life of drug and its significance, Drug-drug interactions. Principles and mechanism of drug action,Factors affecting drug action. General considerations, pharmacological classification, mechanism of action and uses of following classes of drugs acting on various systems.										
Unit III	anaesthesia, Gen hypnosis and s	Drugs acting on CNS (a) Mechanism of General anaesthesia, Stages of anaesthesia, General anaesthetics (Nitric oxide, halothane), (b) Principles of hypnosis and sedatives: sedative and hypnotics drugs (Phenobarbitone, diazepam), (c) Opioid analgesics (Morphine) (d) CNS stimulants (strychnine, amphetamine).									
Unit IV	Autocoids and an NSAID and oth antifungal (ampho	er dru	igs (as		ts Drug therapy of inflammation, celecoxib). Antibacterial (sulfonamides),	08					
Unit V	Hormones and h	ormon de, ros esti	e anta siglitaz rogen	ione),	s Insulin and oral hypoglycaemic thyroid and anti-thyroid drugs (eltroxin, and progestins (progesterone,	08

Course code	BMD-502										
Category	Department Specific Elective										
Course title	Radiation Biology										
Scheme and Credits	Credit	L 4	T 0	P 0	-						
Pre- requisites (if any)	4 Cell Biology		0	0							
Objectives	Biology is essentially the study of life in all of its varied forms. Because cells are the 'basic unit of life', the study of cells can be considered one of the most important areas of biological research. This course will provide information about cells, including their composition, their function and cell-cycle checkpoints. The module on radiation biology will help to explore and gain insight into radiation-induced biological responses at molecular, cellular and tissue levels.										
Outcomes	 End of this course students would be able to: Describe direct and indirect interactions between radiation and cells. Describe the molecular basis of cellular radiosensitivity. Explain the influence of cell cycle, repair, repopulation and reoxygenation on tissue radiosensitivity. Describe the components of a cell survival curve. Given clinical data, draw a cell survival curve. Differentiate between cell survival curves of varying LET radiations, hypoxic and aerated cells as well as cell cycle phases. Identify the acute and late effects of radiation on living tissue. Describe the long term effects of radiation. Explain the effects of radiation on the developing embryo and fetus at each stage. Explain the effects of time, dose and fractionation on long term side effects and treatment effectiveness. 12. Describe the relationship between LET, RBE and OER. 										
Unit I	Basic principles of numbers and frequ		-		radiation: Energy, wavelength, waveectronic structure of molecules.	08					
Unit II	radioactive decay of radioactivity n upon excitation (understanding of transcription (labe Use of radioisoto (thyroid disorder (ionizing and non	Introduction of radiation biology : Basic concept of radioisotopes, types of radioactive decay (gamma and beta emitter), half-life, detection and measurement of radioactivity methods based upon ionization (GM counter), methods based upon excitation (scintillation counter). Use of radioisotopes in cell biology in understanding of DNA replication (bidirectional and theta replication), transcription (labeling of RNA) and labeling of protein using labeled amino acid. Use of radioisotopes in biology: Autoradiography, radioisotopes in diagnosis (thyroid disorders, cancer) and therapy (radiotherapy). Effect of radiations (ionizing and non-ionizing) on living systems, radiation induced damage to cell (chromosome and DNA damage), precautions and safety measures in handling radioisotopes.									
Unit III	law, light absorpti of a chromophore light., Fluorescen	on and , struc ce spe	l its tra tural a ctrosco	insmit nalyse opy: T	JV-visible spectrophotometry: Beer Lambert tance, factors affecting absorption properties es of DNA/ protein using absorption of UV Theory of fluorescence, static and dynamic r, fluorescent probes in the study of protein	08

Pre- requisites (if any)	None											
Objectives	The main focus of this programme is to promote professional management practices that are necessary for effective healthcare ensuring continuous quality improvement, labour relations, financial sustainability, awareness creation, demand generation, optimum utilization of limited available resources and strategic approach towards inflation, rapid advancement in medical technology, increased expectations of staff and patients.											
Outcomes	 In the end of this course students would be able to: Understand the need and importance of cost effective sustainable healthcare through demand generation and enhanced quality care Develop and apply various employee friendly systems for effective functioning of different administrative activities and support services of hospital Promote patient centred care with a continuous quality improvement orientation ensure smooth functioning of core process by forecasting, streamlining patient flow, staff scheduling, planning space/ facilities/ supplies, maintenance, etc. Ensure optimum tilization of available limited resources. Sharpen managerial skills. Have an appreciation on the use of information technology in the hospital 											
Unit I	Organization Of the Hospital: Organizational structure, governance, duties and responsibility of governing board, management structure, Management process and functions, nature of management process and managerial functions planning, organizing, staffing, directing, coordinating and controlling, Application of managerial functions to health care organizations.											
Unit II	Planning Admini	strativ resour	ve serv	ices:	Financial management, Hospital information ent, Public relations department, nursing	08

Objectives	The recent advances in the field of biotechnology have brought into focus several safety and ethical issues. The inventions in the field of genetic engineering and related fields of molecular biology not only affect us but also the plants, microorganisms, animals and the entire environment and the way we practice agriculture, medicine and food processing. An increase in our ability to change life forms in recent years has given rise to the new science of bioethics. The present course focus on the biosafety and bioethical issues the modern society confronts. Topics such as biosafety levels, GM food debate, impact of biotechnology on biosafety, biotech products and ethical issues, governance of biosafety, environmentally responsible use of biotechnology, clinical ethics will be discussed in the curriculum.											
Outcomes	 provide stude in bioethics train students ethics, especia provide stude 	 in bioethics train students in examining and analyzing the salient topics of contemporary healthcare ethics, especially regarding their normative, global and religious dimensions provide students with clinical experience through rotations in various clinical settings

(if any) Objectives	considered to ha considered as int and society at lar new and useful understand the ne the area. Various	Developments in the recent years has increased the knowledge acquisition process which is considered to have commercial value as well. The knowledge pool so generated can be considered as intellectual property which has grown tremendously in academic community and society at large. The pace with which our modern science is progressing today, various new and useful inventions take place. Through this paper, students are made aware to understand the need for creation, protection, and commercialization of intellectual property in the area. Various forms of Intellectual Property Rights are also explained. Paper also deals with the entire process of patent filling, taking some case studies.										
Outcomes	The students once patent and copyrig	The students once they complete their academic projects, they get awareness of acquiring the patent and copyright for their innovative works. They also get the knowledge of plagiarism in their innovations which can be questioned legally.										
Unit I	Introduction: meaning of property, origin, nature, meaning of intellectual property rights, provision of ipr under trips and wto. B.Sc Biomedical (2018-19) COs Mapping with POs & PSOs (Three Level : 3-Strongly Related , 2-Moderate, 1-Slightly)

BBM-101Human Anatomy and Physiology

Course Outcomes:

CO 1:Major skeletal muscles, their actions, origins, insertions, and peripheral nerves. c. Central nervous system and plexuses d. Respiratory system e. Cardiovascular/hematologic system

CO 2:Identify the major structures of the human anatomy for the following: a. Head and neck, thoracic, abdominopelvic, and upper and lower extremities. b. Major skeletal muscles, their actions, origins, insertions, and peripheral nerves. c. Central nervous system and plexuses d. Respiratory system e. Cardiovascular/hematologic system

CO 3:Identify the major bones and their processes as they relate to each region of the body.

CO 4:Briefly tell the basic components and functions of the gastrointestinal, renal/urinary, endocrine/metabolic, hepatic/biliary, genital/reproductive and immunologic, systems.

CO 5:Identify the findings from a simulated healthcare record such as electrocardiogram data and pulmonary ventilation outcomes.

BBM-102 Organic Chemistry

Course Outcomes:

reactions along with introduction to biomolecules

CO 1:Know and recall the fundamental principles of organic chemistry that include chemical bonding, nomenclature, structural isomerism, stereochemistry, chemical reactions and mechanism.

CO 2:Name the functional groups and different class of organic compounds. Recognize the basic practical skills for the synthesis and analysis of organic compounds.

CO 3:Predict the reactivity of an organic compound from its structure; Develop basic skills for the multi-step synthesis of organic compounds; Justify a reasonable mechanism for a chemical reaction.

CO 4:Demonstrate ability to work independently as well as within a team.

CO 5:Manage resources and time and get along well with other members of the group.

BBM-152 Organic Chemistry Lab

Course Outcomes:

CO 1: Preparation of solutions based on molarity, normality, percentage, dilutions etc.

CO 2: Preparation of buffers.

CO 3: Qualitative tests for carbohydrates to identify the given unknown carbohydrate solution: Mohlisch, Barfoed, Fehling/ Tollen/ Benedict, Selvinoff, Osazone, Bial^{**}stests.

CO 4: To determine the Iodine number of the given oil/ fat.

CO 5: To find pKa value of given acetic acid/ amino acid.

CO 6: Qualitative test for the protein

CO 7: Isolation of the casein from the milk sample

CO 8:Qualitative test for the amino acids.

GBT-101 Basic Cell Biology

Course Outcomes:

CO1: Students will understand the structures and purposes of basic components of prokaryotic and eukaryotic cells, especially macromolecules, membranes, and organelles

CO2: Students will understand how these cellular components are used to generate and utilize energy in cells

CO3: Students will understand the cellular components underlying mitotic cell division. 4. Students will apply their knowledge of cell biology to selected examples of changes or losses in cell function. These can include responses to environmental or physiological changes, or alterations of cell function brought about by mutation.

GBT-151 Cell Biology Lab

Course Outcomes:

CO1:Microscopy- Theoretical knowledge of Light and Electron microscope.

CO2:To study the following techniques through electron/ photomicrographs: fluorescence microscopy, autoradiography, positive staining, negative staining, freeze fracture, freeze etching shadow casting, endocytosis and phagocytosis.

CO3:To explain mitosis and meiosis using permanent slides.

CO4:To cytochemically demonstrate presence of proteins in cheek cells or onion peel using mercuric bromophenol blue or fast green.

CO5:To cytochemically demonstrate presence of carbohydrates in cheek cells or onion peel using periodic acid Schiff's reagent.

CO6: To cytochemically demonstrate presence of DNA in cheek cells or onion peel using Feulgen reagent.

CO7:To study the effect of isotonic, hypotonic and hypertonic solutions on cells. 8. To prepare polytene chromosomes.

Course Outcomes:

CO 1:Trace the history and development of immunology.

CO 2:Describe surface membrane barriers and their protective functions.

CO 3:Explain the importance of phagocytosis and natural killer cells in innate body defense.

CO 4:Describe the roles of different types of T cells, B cells and APCs. Compare and contrast the origin,

maturation process, and general function of B and T lymphocytes.

BBM-252 Immunology Lab

Course Outcomes:

CO1: Estimation of hemoglobin (Sahli"s method) and determination of blood group.

CO2: Determination of bleeding time and clotting time of blood.

CO3: Determination of total erythrocyte count.

CO4: Determination of total leukocyte count.

CO5: Preparation of blood smears and identifying various WBC

CO6: To perform differential leukocyte count of blood.

CO7: Determination of specific gravity of blood.

CO8:Determination of osmotic fragility.

GBT-201 Principles of Genetics

Course Outcomes:

CO1:Discussing the progression of discovery from Classical to Modern Genetics.

CO2:Defining basic concepts of Classical Genetics.

CO3:Describing Mendel's experimental design.

CO4:Utilizing conventional Mendelian genetic terminology.

CO5: Explaining Mendel's principles of segregation, and independent assortment.

CO6:Solving monohybrid¬cross genetic outcomes utilizing branch diagrams and/or Punnett squares.

CO7:Using testcrosses to identify parental genotype and confirm the principle ofsegregation.

CO8:Solving dihybrid cross genetic outcomes utilizing branch diagrams and/or Punnett squares.

CO9: Analyzing the results of multihybrid crosses to confirm the principle of Independent Assortment.

CO10:Using the laws of probability to statistically analyze the outcomes of genetic crosses.

GBT-251 Genetics Lab

Course Outcomes:

CO1: Verification of Mendelian laws through dominant, recessive, test and back cross.

CO2: Verification of sex-linked characteristics, linkage and crossing over mechanism.

CO3: Verification of population genetics

CO4:Pedigree charts of some common characters like blood group, color blindness and PTC testing

BBM-301 Analytical Instrumentation and its Applications

Course Outcome:CO 1: Strategically plan analytical campaigns to apply to different types of samples and research objectives, including selection of the most appropriate technique/instrumentation for the students' research project.

CO 2: Undertake the correct sample preparation and characterization prior to analysis by the chosen techniques or instruments.

CO 3: Design an analytical workflow to acquire data and achieve the research objectives of their project.

CO 4: Process data from the chosen instruments and demonstrate understanding of the limitations and quality of the data. Justify the approach taken to data processing.

CO :5Write a clear and concise justification and description of the analytical techniques employed, suitable for publication in a scientific journal.

BBM-351 Analytical Instrumentation Lab

CO1:Effect of different solvents on UV absorption spectra of proteins.

CO2: Study of structural changes of proteins at different pH using UV spectrophotometry.

CO3:Study of structural changes of proteins at different temperature using UV spectrophotometry. 4.

Determination of melting temperature of DNA.

CO4:Study the effect of temperature on the viscosity of a macromolecule (Protein/DNA).

CO5:Use of viscometry in the study of ligand binding to DNA/protein.

CO6:Crystallization of enzyme lysozyme using hanging drop method.

CO7: Analysis, identification and comparison of various spectra (UV, NMR, MS, IR) of simple organic compounds

CO8:Determination of molar composition of complex

CO9:Determination of indicator constant of an indicator.

CO10: Determination of physico-chemical parameters of water

CO11:Estimation of free fatty acid in oil

CO12:Determination of serum cholesterol

CO13:Estimation of reducing sugar

CO14:Estimation of amino acid by Ninhydrin method

Course Outcomes:

CO15: Estimation of protein by Lowry met

BBM-302 Medical Physics

Course Outcomes:

CO1:Describe the construction and function of the x-ray system.

CO2:Describe the image formation process on radiographic film and digital imaging plates.

CO3:Describe the conversion of a latent x-ray image into a radiologic image.

CO4:Compare and contrast x-ray images with different quality characteristics.

CO5:Describe how x-ray images are developed in a rapid film processor.

CO6:Compare and contrast the basic radiation interactions that occur in matter exposed to x-rays.

CO7:Explain how scattered radiation can affect the film and how its effects can be minimized.

CO8:Recommend methods of improving an x-ray image with deficits.

CO9:Describe the operating characteristics of conventional tomography

be introduced.

CO10: Explain how fluoroscopy differs from conventional overhead radiography

BBM-303 Molecular Biology

Course Outcomes:

CO1:Exhibit a knowledge base in genetics, cell and molecular biology, and anatomy and physiology

CO2:Demonstrate the knowledge of common and advanced laboratory practices in cell and molecular biology **CO3:**Exhibit clear and concise communication of scientific data

CO4:Engage in review of scientific literature in the areas of biomedical sciences

and eukaryotic replication, transcription and translation processes.

CO5:Critique and professionally present primary literature articles in the general biomedical sciences field.

BBM-353 Molecular Biology Lab

Course Outcomes:

CO1: Preparation of various stock solutions required for Molecular Biology Laboratory.

CO2: Preparation of culture medium (LB) for E. coli (both solid and liquid) and raise culture of E. coli.

CO3: Isolation of chromosomal DNA from bacterial cultures and visualization on Agarose Gel Electrophoresis.

CO4: Quantitative estimation of DNA using colorimeter (Diphenylamine reagent) and Spectrophotometer (A260 measurement)

(A260 measurement).

CO5: Isolation of genomic DNA from blood/ tissue.

CO6:Demonstration of Polymerase Chain Reaction (PCR) technique

GBT-301 Microbiology

Course Outcomes:

CO1: Students will be able to acquire, articulate, retain and apply specialized language and knowledge relevant to microbiology.

CO2: Students will acquire and demonstrate competency in laboratory safety and in routine and specialized microbiological laboratory skills applicable to microbiological research or clinical methods, including accurately reporting observations and analysis.

CO3: Students will communicate scientific concepts, experimental results and analytical arguments clearly and concisely, both verbally and in writing.

CO4:Students will demonstrate engagement in the Microbiology discipline through involvement in research or internship activities, the Microbiology Student Association club (MSA) and outreach or mentoring activities specific to microbiology.

GBT-351 Microbiology Lab

Course Outcomes:

CO1: Preparation of different media: synthetic media, Complex media-nutrient agar, Luria Agar.

CO2: Staining methods: Gram's staining, Acid fast staining (permanent slide only), Capsule staining and spore staining.

CO3: Study and plot the growth curve of E coli using turbidometric method and to calculate specific growth rate and generation time.

CO4: To perform antibacterial testing by Kirby-Bauer method.

CO5: Staining and morphological characterization of Aspergillus sp., Pencillium sp. and Saccharomyces sp. **CO6:** Demonstration of PCR based method of detection.

CO7: Isolation of bacteriophages (any with a non-pathogenic host) and calculation of the plaque forming units (pfu)

BBM-403 Biochemistry

Course Outcomes:

CO1:Demonstrate a broad knowledge of the fundamental introductory concepts of Chemistry, Biology and Physics.

CO2:Demonstrate a thorough knowledge of the intersection between the disciplines of Biology and Chemistry. **CO3:**Demonstrate a proficiency in developing relevant biochemical questions, carrying out laboratory investigations to answer those questions, and critically analyzing, interpreting, and presenting in oral and written form the results of their experiments.

CO4:Locate, critically analyze, interpret and discuss data, hypotheses, results, theories, and explanations found in the primary literature, applying knowledge from Chemistry and Biology.

CO5:Appreciate the way in which practitioners in the disciplines of Biology and Chemistry intersect and bring their expertise to bear in solving complex problems involving living systems.

CO6:Understand the societal impacts, both positive and negative, of science and technology and the limitations of science.

GBT-401 Toxicology

Course Outcomes:

CO1:Critically evaluate different advanced exposure assessment methods

CO2:Design strategies for exposure assessment

CO3: Analyse and interpret exposure measurements applying different modelling tools (stochastic and deterministic)

CO4:Characterize measurement error and its consequences can be assimilated during subsequent higher studies. **CO5:**Appreciate the advantages and disadvantages of toxicological and epidemiological studies for deriving dose-response relationships

GBT-451 Toxicology Lab

Course Outcomes:

CO1: Separation of a mixture of benzoic acid, beta- napthol and naphthalene by solvent extraction and identification of their functional Groups.

CO2: Determination of Dissolved oxygen (DO) using Winkler's method.

CO3: Determination of Biological oxygen demand (BOD) of water.

CO4: To perform quantitative estimation of residual chlorine in water samples.

CO5: To determine the total hardness of water by complexo-metric method using EDTA.

CO6: To determine acid value of the given oil sample.

CO7: To estimate formaldehyde content of given sample.

CO8: Calculation of LD50 value of an insecticide from the data provided.

CO9: Determination of COD (chemical oxygen demand) of the given water sample.

BMD-502 Radiation Biology

Course Outcomes:

CO1: Describe direct and indirect interactions between radiation and cells.

CO2: Describe the molecular basis of cellular radiosensitivity.

CO3: Explain the influence of cell cycle, repair, repopulation and reoxygenation on tissue radio sensitivity.

CO4: Describe the components of a cell survival curve.

CO5: Given clinical data, draw a cell survival curve.

CO6: Differentiate between cell survival curves of varying LET radiations, hypoxic and aerated cells as well as cell cycle phases.

CO7: Identify the acute and late effects of radiation on living tissue.

CO8: Describe the effects of whole body radiation.

CO9: Describe the long term effects of radiation.

CO10: Explain the effects of radiation on the developing embryo and fetus at each stage.

CO11: Explain the effects of time, dose and fractionation on long term side effects and treatment effectiveness.

CO12:Describe the relationship between LET, RBE and OER.
